NAME

sched - Job scheduler.

SYNOPSIS

load=sched.exe

DESCRIPTION

Insert into the section **[windows]** in the file **win.ini**:

load=sched.exe

Sched runs idle waiting for jobs. If a job is passed to **sched**, **sched** changes to the directory specified in the job, and runs the program (with optional parameters) specified in the job as a child process. If the last specified parameter is the **&** symbol, the program will run minimized.

Sched tries to find the program in the current directory, in the directories specified in the environment variable **PATH**, in the Windows directory and in the Windows system directory.
