

**What's Up, Doc?** provides a skeletal example of how you might manage multiple documents in an application. The actual documents are of little utility (they contain one line of text in a text field), but the functionality of **What's Up, Doc?** provides a basis for a full-fledged application.

Some of the functions demonstrated in What's Up Doc? include:

- A full compliment of **Save**, **SaveAs**, **SaveTo** functions.
- A **Revert** function to restore a document from the last saved version.
- Methods for reading and writing the document that only saves the variable parts of the document (not the entire document window).
- If a user closes a window that has been edited, **What's Up, Doc?** will query if they wish to save the window before it's closed.
- If the user quits the application with edited documents, **What's Up, Doc?** will offer the chance to review unsaved documents.

**What's Up Doc?** maintains the notion of an "active document" which receives most of the actions initiated by the user.
