

CommentKeeper 1.0 is a freeware extension for System 7. One missing feature in System 6 was that the so-called "Get Info" comments were erased whenever the desktop file was rebuilt. Apparently, a remedy for this never came to fruition in System 7. In fact, the only change made was that the Finder now warns users that the info comments will be erased. **CommentKeeper** provides a solution to this problem by preserving the info comments whenever the desktop file is rebuilt. **CommentKeeper** also works with System 6 if the Desktop Manager extension is present at startup.

For those users using System 6 with the Desktop Manager extension, **CommentKeeper** can be installed. To do this, drag the **CommentKeeper** file icon into your System Folder and reboot. Be certain that the Desktop Manager loads *before* **CommentKeeper**. To accomplish this, rename either CommentKeeper or the Desktop Manager to reverse their alphabetical order.

To install it under System 7, drag the **CommentKeeper** file icon over the System Folder icon and click OK to the dialog or drag it directly into the Extensions folder and reboot.

The desktop file is a file used by the Finder containing information about which documents go with which applications. It allows the Finder to know which icons to display for a file and which application to open a document is opened in the Finder. Over time and especially if the user adds and removes applications, the desktop file grows slowing down Finder operation. A useful optimization is to rebuild the desktop file, and the Finder provides a method. Upon its launching at startup, hold down the command and option keys. A dialog appears asking if the user is sure about rebuilding the desktop file. Normally, in System 7, this dialog also says that the info comments will be erased.

However, after **CommentKeeper** is installed, the dialog says that the info comments will, in fact, be saved (This part won't work if for foreign System files. It is then necessary to copy the second string from the 'STR#' 11500 resource in the Finder to the first string in the 'STR#' -4047. Finally, the second string in 'STR#' -4047 should be translated, leaving the ^1 intact). Just after clicking OK, the cursor will change to a miniature animated Get Info window as **CommentKeeper** searches the hard disk for comments. After a short time, the Finder will resume the task of rebuilding the desktop file. Upon its conclusion, if any comments were found, **CommentKeeper** adds them to the new desktop file, and the cursor will once again change to a miniature Get Info window for a very short time. Lo and behold, the comments should appear intact as if the desktop file were never touched.

One caveat in using **CommentKeeper** is that the Desktop Manager should have already been running and installed before installing **CommentKeeper**. For example, install System 7 and boot from it, letting it rebuild the desktop file for the first time, before installing **CommentKeeper**. Also, there is no harm in running **CommentKeeper** if there are no "Get Info" comments, though it's unnecessary: You only need to have **CommentKeeper** installed whenever you wish to rebuild the desktop file.

To disable **CommentKeeper** from loading at startup hold down the shift key.

Distribution of **CommentKeeper** must be accompanied with this documentation.

CommentKeeper comes from
