

About OpenFolder 7

Double-click on the OpenFolder 7 icon. A "standard file" dialog appears. Select the folder you want to open, and click on the Folder button. OpenFolder sends an Apple event to the System 7 Finder, telling it to open the folder you selected.

It's such a small simple little thing -- almost a no-brainer, but it's very useful. And it's a new thing that's only possible with System 7 and Apple events. OpenFolder 7 is especially useful if you already use Boomerang from Now Software. Suggestion: put the Open Folder 7 icon on your Finder desktop so it's very easy to double-click on.

Originally this was a script written in the UserLand Frontier™ scripting language. We hand-compiled it into C and built it using THINK C 4.0. If you want more information about Frontier, call us at the phone number below; tell 'em OpenFolder 7 sent you!
