Specification for the
Advanced Amiga (AA) Chip Set

TYPED BY FIREFLASH/C18,SPONGE/C18
AMIGAGUIDE VERSION & PAGE 19 BY SCHWARZENEGGER/TFA

Please select any of the topics listed below and follow up on the links
as they appear.

1. Summary of new features for AA
2. Explanation of new features
3. List of Registers ordered by address
4. List of Registers ordered alphabetically
5. New LISA Display & Sprite Modes

1.2 summary

1. Summary of new features for AA
---

32 bit wide data bus supports input of 32-bit wide bitplane data and allows doubling of memory bandwidth. Additional doubling of bandwidth can be achieved by using FAST page mode Ram. The same bandwidth enhancements are available for sprites. Also the maximum number of bitplanes useable in all modes was increased to eight (8).

The color Palette has been expanded to 256 colors deep and 25 bits wide (8 RED,8 GREEN,8 BLUE,1 GENLOCK). This permits display of 256 simultaneous colors in all resolutions. A palette of 16,777,216 colors are available in all resolutions.

28Mhz clock input allows for cleaner definition of HIRES and SHRES pixels
ALICE'S clock genarator is synchronized by means of LISA's 14MHz and SCLK
outputs, Genlock XCLK and XCLKEN pins have been eliminated (external MUX is
now required).

A new register bit allows sprites to appear in the screen border regions
(BRDRSPRT - See BPLCON3).

A bitplane mask field of 8 bits allows an address offset into the color
palette.
Two 4-bit mask fields do the same for odd and even sprites.

In Dual Playfield modes,2 4-bitplane playfields are now possible in all
resolutions.

Two Extra high-order playfield scrollbits allow seamless scrolling of up to
64 bit wide bitplanes in all resolutions. Resolution of bitplane scroll,
display window,and horizontal sprite position has been improved to 35ns in
all resolutions.

A new 8-bitplane HAM mode has been created, 6 for colors and 2 for control
bits. All HAM modes are available in all resolutions (not just LORES as
before).

A RST_input pin has been added, which resets all the bits contained in
registers that were new for ECS or LISA:
BPLCON3, BPLCON4, CLXCON2, DIWHIGH, FMODE.

Sprite resolution can be set to LORES,HIRES,SHRES,independant of bitplane
resolution.

Attached Sprites are now available in all resolutions.

Hardware Scan Doubling support has been added for bitplanes and sprites.
This is intended to allow 15KHz screens to be intelligently displayed on a
31KHz monitor and share the display with 31KHz screens.

1.3 explanation

2. Explanation of new features

Bitplanes

There are now 8 bitplanes instead of 6. In single playfield modes they can
address 256 colors instead of 64. As long as the memory architecture can
support the bandwidth, all 8 bitplanes are available in all 3 resolutions
In the same vein, 4+4 bitplane dualplayfield is available in all 3
resolutions, unless bitplane scan-doubling is enabled, in which case
both playfields share the same bitplane modulus register. Bits 15 thru 8 of
BPLCON4 comprise an 8 bit mask for the 8 bitplane address, XOR'ing the
individual bits. This allows the copper to exchange color maps with a
single instruction.

BPLCON1 now contains an 8 bit scroll value for each of the playfields. Granularity of scroll now extends down to 35nSec.(1 SHRES pixel), and scroll can delay playfield thru 32 bus cycles. Bits BPAGEM and BPL32 in new register FMODE control size of bitplane data in BPL1DAT thru BPL8DAT.

The old 6 bitplane HAM mode, unlike before, works in HIRES and SHRES resolutions.

As before bitplanes 5 and 6 control it's function as follows:

BP6	BP5	RED	GREEN	BLUE
0	0	select new base register (1 of 16)		
0	1	hold	hold	modify
1	0	modify	hold	hold
1	1	hold	modify	hold

There is a new 8 bitplane HAM (Hold and Modify) mode. This mode is invoked when BPU field in BPLCON0 is set to 8 , and HAMEN is set. Bitplanes 1 and 2 are used as control bits analagous to the function of bitplanes 5 and 6 in 6 bitplane HAM mode:

BP2	BP1	RED	GREEN	BLUE
0	1	select new base register (1 of 64)		
0	1	hold	hold	modify
1	0	modify	hold	hold
1	1	hold	modify	hold

Since only 6 bitplanes are available for modify data, the data is placed in 6 MSB. The 2 LSB are left unmodified, which allows creation of all 16,777,216 colors simultaneously, assuming one had a large enough screen and picked one's base registers judiciously. This HAM mode also works in HIRES and SHRES modes.

For compatibility reasons EHB mode remains intact. Its existence is rather moot in that we have more than enough colors in the color table to replace its functionality. As before, EHB is invoked whenever SHRES = HIRES = HAMEN= DPF = 0 and BPU = 6. Please note that starting with ECS DENISE there is a bit in BPLCON2 which disables this mode (KILLEHB).

Bits PF2OF2,1,0 in BPLCON3 determine second playfield's offset into the color table. This is now necessary since playfields in DPF mode can have up to 4 bitplanes. Offset value are as defined in register map.

BSCAN2 bit in FMODE enables bitplane scan-doubling. When V0 bit of DIWSTRT matches V0 of vertical beam counter, BPL1MOD contains the modulus for the

display line, else BPL2MOD is used. When scan-doubled both odd and even bitplanes use the same modulus on a given line, whereas in normal mode odd bitplanes used BPL1MOD and even bitplanes used BPL2MOD. As a result Dual Playfields screens will probably not display correctly when scan-doubled.

Sprites

Bits SPAGEM and SPR32 in FMODE whether size of sprite load datain SPR0DATA(B) thru SPR7DATA(B) is 16,32, or 64 bits, analagous to bitplanes. BPLCON3 contains several bits relating to sprite behavior. SPRES1 and SPRES0 control sprite resolution, whether they conform to theECS standard or override tp LORES,HIRES,or SHRES. BRDRSPRT, when high,allows sprites to be visible in border areas. ESPRM7 thru ESPRM4 allow relocation of the even sprite color map. OSPRM7 thru OSPRN4 allow relocation of the odd sprite color map. In the case of attached sprites OSPRM bits are used.

SSCAN2 bit in FMODE enables sprite scan-doubling. When enabled, individual SH10 bits in SPRxPOS registers control whether or not a given sprite is to be scan-doubled. When V0 bit of SPRxPOS register matches V0 bit of vertical beam counter, the given sprite‘s DMA is allowed to proceed as before. If the don‘t match, then sprite DMA is disabled and LISA reuses the sprite data
from the previous line. When sprites are scan-doubled, only the position and control registers need be modified by the programmer; the data registers need no modification.

NOTE: Sprite vertical start and stop positions must be of the same parity, i.e. both odd or even.

Compatibility

RST_pin resets all bits in all registers new to AA. These registers include: BPLCON3, BPLCON4, CLXCON2, DIWHIGH, FMODE.

ECSENA bit (formerly ENBPLCN3) is used to disable those register bits in BPLCON3 that are never accessed by old copper lists, and in addition are required by old style copper lists to be in their default settings.Specifically ECSENA forces the following bits to their default low settings: BRDRBLNK, BRDNTRAN, ZDCLKEN, EXTBLKEN, and BRDRSPRT.

CLXCON2 is reset by a write to CLXCON, so that old game programs will be able to correctly detect collisions.

DIWHIGH is reset by writes to DIWSTRT or DIWSTOP. This is interlock is inhertied from ECS Denise.

Genlock

Lots of new genlock features were added to ECS DENISE and arecarried over to LISA. ZDBPEN in BPLCON2 allows any bitplane, selected by ZDBPSEL2,1,0,to be used as a transparency mask (ZD pin mirrors contents of selected bitplane). ZDCTEN disables the old COLOR00 is transparent mode, and allows the bit31 position of each color in the color table to control transparency.ZDCLKEN generates a 14MHz clock synchronized with the video

data that can be used by video post-processors. Finally, BRDNTRAN in BPLCON3 generates an opaque border region which can be used to frame live video.

Color Lookup Table

The color table has grown from 32 13-bit registers to 256 25-bit registers. Several new register bits have been added to BPLCON3 to facilitate loading the table with only 32 register addresses. LOCT, selects either the 16 MSB or LSB for loading. Loading the MSB always loads the LSB as well for compatibility, so when 24 bit colors are desired load LSB after MSB. BANK2,1,0 of 8 32 address banks for loading as follows:

BANK2	BANK1	BANK0	COLOR ADDRESS RANGE
0	0	0	COLOR00 - COLOR1F
0	0	1	COLOR20 - COLOR3F
0	1	0	COLOR40 - COLOR5F
0	1	1	COLOR60 - COLOR7F
1	0	0	COLOR80 - COLOR9F
1	0	1	COLORA0 - COLORBF
1	1	0	COLORC0 - COLORDF
1	1	1	COLORE0 - COLORFF

RDRAM bit in BPLCON2 causes LISA to interpret all color table accesses as reads.
Note: There is no longer any need to "scramble" SHRES color table entries. This artifice is no longer required and pepole who bypass ECS graphics library calls to do their own 28MHz graphics are to be pointed at and publicly humiliated.

Collision

A new register CLXCON2 contains 4 new bits. ENBP7 and ENBP6 are the enable bits for bitplanes 7 and 8, respectively. Similarly, MVBP7 and MPBP8 are their match value bits. CLXDAT is unchanged.

Horizontal Comparators

All programmable comparators with the exception of VHPOSW have 35nSec resolution.: DIWHIGH, HBSTOP, SPRCTL, BPLCON1. BPLCON1 has additional high-order bits as well. Note that horizontal bit position representing 140nSec resolution has been changed to 3rd least significant bit,where before it used to be a field‘s LSB, For example, bit 00 in BPLCON1 used to be named PF1H0 and now it‘s called PF1H2.

Coercion of 15KHz to 31KHz:

We have added new hardware features to LISA to aid in properly displaying 15KHz and 31KHz viewports together on the same 31KHz display. LISA can globally set sprite resolution to LORES, HIRES, or SHRES.

LISA will ignore SH10 compare bits in SPRxPOS when scan-doubling, thereby allowing ALICE to use these bits individually set scan-doubling.

1.4 registersindex

3. List of registers ordered by address

Symbols Used:

& = Register used by DMA channel only.
% = Register used by DMA channel usually, processors sometimes.
+ = Address register pair. Low word uses DB1-DB15, High word DB0-DB4.
~ = Address not writable by the coprocessor unless COPCON bit 1 is set true
h = new for HiRes chip set.
p = new for IAA chip set.
A = Agnus/Alice chip set.
D = Denise/Lisa chip set.
P = Paula chip.
W = Write.
R = Read.
ER= Early read. This is a DMA transfer to RAM, from either the disk or from the blitter. Ram timing requires data to be on the bus earlier than microprocessor read cycles. These transfers are therefore initiated by Agnus timing, rather than a read address on the register address bus (RGA).
S = Strobe (Write address with no register bits).
PTL,PTH = 20 bit pointer that addresses DMA data. Must be reloaded by a processor before use (Vertical blank for bit plane and sprite pointers. and prior to starting the blitter for blitter pointers). (old chips - 18 bits).
LCL,LCH = 20 bit location (starting address) of DMAdata. Used to automatically restart pointers. such as the Coprocessor program counter (during vertical blank), and the audio sample counter (whenever the audio lentgh count is finished), (Old chips - 18 bits).
MOD = 15 bit Modulo. A number that is automatically added to the memory address at the end of each line to generate the address for the beginning of the next line. This allows the blitter (or the display window) to operate on (or display) a window of data that is smaller than the actual picture in memory. (memory map) Uses 15 bits, plus sign extended.

NAME		ADDR	R/W	CHIP(s)		FUNCTION
BLTDDAT	&	~000	ER	A		Blitter dest. early read (dummy address)
DMACONR		~002	R	A	P	Dma control (and blitter status) read
VPOSR		~004	R	A		Read vert most sig. bits (and frame flop
VHPOSR		~006	R	A		Read vert and horiz position of beam
DSKDATR	&	~008	ER		P	Disk data early read (dummy address)
JOY0DAT		~00A	R	D		Joystick-mouse 0 data (vert,horiz)
JOT1DAT		~00C	R	D		Joystick-mouse 1 data (vert,horiz)
CLXDAT		~00E	R	D		Collision data reg. (read and clear)
ADKCONR		~010	R		P	Audio,disk control register read
POT0DAT		~012	R		P	Pot counter pair 0 data (vert,horiz)

POT1DAT		~014	R		P		Pot counter pair 1 data (vert,horiz)
POTINP		~016	R		P		Pot pin data read
SERDATR		~018	R		P		Serial port data and status read
DSKBYTR		~01A	R		P		Disk data byte and status read
INTENAR		~01C	R		P		Interrupt enable bits read
INTREQR		~01E	R		P		Interrupt request bits read
DSKPTH	+	~020	W	A			Disk pointer (high 5 bits)
DSKPTL	+	~022	W	A			Disk pointer (low 15 bits)
DSKLEN		~024	W		P		Disk lentgh
DSKDAT	&	~026	W		P		Disk DMA data write
REFPTR	&	~028	W	A			Refresh pointer
VPOSW		~02A	W	A			Write vert most sig. bits(and frame flop)
VHPOSW		~02C	W	A	D		Write vert and horiz pos of beam
COPCON		~-2E	W	A			Coprocessor control reg (CDANG)
SERDAT		~030	W		P		Serial port data and stop bits write
SERPER		~032	W		P		Serial port period and control
POTGO		~034	W		P		Pot count start,pot pin drive enable data
JOYTEST		~036	W		D		Write to all 4 joystick-mouse counters at once
STREQU	&	~038	S		D		Strobe for horiz sync with VB and EQU
STRVBL	&	~03A	S		D		Strobe for horiz sync with VB (vert blank)
STRHOR	&	~03C	S		D	P	Strobe for horiz sync
STRLONG	&	~03E	S		D		Strobe for identification of long horiz line
BLTCON0		~040	W	A			Blitter control reg 0
BLTCON1		~042	W	A			Blitter control reg 1
BLTAFWM		~044	W	A			Blitter first word mask for source A
BLTALWM		~046	W	A			Blitter last word mask for source A
BLTCPTH	+	~048	W	A			Blitter pointer to source C (high 5 bits)
BLTCPTL	+	~04A	W	A			Blitter pointer to source C (low 15 bits)
BLTBPTH	+	~04C	W	A			Blitter pointer to source B (high 5 bits)
BLTBPTL	+	~04E	W	A			Blitter pointer to source B (low 15 bits)
BLTAPTH	+	~050	W	A			Blitter pointer to source A (high 5 bits)
BLTAPTL	+	~052	W	A			Blitter pointer to source A (low 15 bits)
BPTDPTH	+	~054	W	A			Blitter pointer to destn D (high 5 bits)
BLTDPTL	+	~056	W	A			Blitter pointer to destn D (low 15 bits)
BLTSIZE		~058	W	A			Blitter start and size (win/width,height)
BLTCON0L	h	~05A	W	A			Blitter control 0 lower 8 bits (minterms)
BLTSIZV	h	~05C	W	A			Blitter V size (for 15 bit vert size)
BLTSIZH	h	~05E	W	A			Blitter H size & start (for 11 bit H size)
BLTCMOD		~060	W	A			Blitter modulo for source C
BLTBMOD		~062	W	A			Blitter modulo for source B
BLTAMOD		~064	W	A			Blitter modulo for source A
BLTDMOD		~066	W	A			Blitter modulo for destn D
		~068					
		~06a					
		~06c					
		~06e					
BLTCDAT	&	~070	W	A			Blitter source C data reg
BLTBDAT	&	~072	W	A			Blitter source B data reg
BLTADAT	&	~074	W	A			Blitter source A data reg
		~076					
SPRHDAT	&h	078	W	A			Ext logic UHRES sprite pointer and data identifier
(BPLHDAT)		~07A	????				?????
LISAID	h	~07C	R		D		Chip revision level for Denise/Lisa
DSKSYNC		~07E	W		P		Disk sync pattern reg for disk read

COP1LCH	+	080	W	A			Coprocessor first location reg (high 5 bits)
COP1LCL	+	082	W	A			Coprocessor first location reg (low 15 bits)
COP2LCH	+	084	W	A			Coprocessor second reg (high 5 bits)
COP2LCL	+	086	W	A			Coprocessor second reg (low 15 bits)
COPJMP1		088	S	A			Coprocessor restart at first location
COPJMP2		08A	S	A			Coprocessor restart at second location
COPINS		08C	W	A			Coprocessor inst fetch identify
DIWSTRT		08E	W	A	D		Display window start (upper left vert-hor pos)
DIWSTOP		090	W	A	D		Display window stop (lower right vert-hor pos)
DDFSTRT		092	W	A			Display bit plane data fetch start.hor pos
DDFSTOP		094	W	A			Display bit plane data fetch stop.hor pos
DMACON		096	W	A		P	DMA control write (clear or set)
CLXCON		098	W		D		Collision control
INTENA		09A	W			P	Interrupt enable bits (clear or set bits)
INTREQ		09C	W			P	Interrupt request bits (clear or set bits)
ADKCON		09E	W			P	Audio,disk,UART,control
AUD0LCH	+	0A0	W	A			Audio channel 0 location (high 5 bits)
AUD0LCL	+	0A2	W	A			Audio channel 0 location (low 15 bits)
AUD0LEN		0A4	W			P	Audio channel 0 lentgh

```

1.5 Some Notes to Start Width

```
4. List of Registers Ordered Alphabetically
-------------------------------------------

P  =  New register in Pandora chip set
p  =  Stuff added or changed in hires chips
H  =  New register in hires chips
h  =  stuff added or changed in hires chips

A  =  Agnus/Alice chip
D  =  Denise/Lisa chip
P  =  Paula chip
```

```
W  =  Write
R  =  Read
ER =  Early read. This is a DMA data transfer to RAM, from either the disk
      or from the blitter, Ram timing requires data to be on the bus
      earlier than microprocessor read cycles. These transfers are
      therefore initiated by Agnus timing, rather than a read address on
      the register address bus (RGA).
```

1.6 ADKCON

```
NAME   rev ADDR type chip Description
-------------------------------------------------------------------------
ADKCON     09E   W   P    Audio,Disk,Uart,Control write
ADKCONR    010   R   P    Audio,Disk,Uart,Control read
```

BITS	USE	DESCRIPTION
15	SET/CLEAR	Set/clear control bit.determines if bits written with a 1 get set or cleared.bits written with a zero are always unchanged.
14-13	PRECOMP 1-0	CODE / PRECOMP VALUE: 00 — none 01 — 140 ns 10 — 280 ns 11 — 560 ns
12	MFMPREC	(1 = MFM precomp / 0 = GCR precomp)
11	UARTBRK	Forces a UART break (clears TXD) if true
10	WORDSYNC	Enables disk read synchronizing on a word equal to DISK SYNC CODE, Located in address DSKSYNC (7E).
09	MSBSYNC	Enables disk read synchrinizing on the MSB (most signif bit) appl type GCR
08	FAST	Disk data clock rate control 1=fast(2us) 0=slow(4us) (Fast for MFM or 2us,slow for 4us GCR)
07	USE3PN	Use audio channel 3 to modulate nothing
06	USE2P3	Use audio channel 2 to modulate period of channel 3
05	USE1P2	Use audio channel 1 to modulate period of channel 2
04	USE0P1	Use audio channel 0 to modulate period of channel 1
03	USE3VN	Use audio channel 3 to modulate nothing
02	USE2V3	Use audio channel 2 to modulate volume of channel 3
01	USE1V2	Use audio channel 1 to modulate volume of channel 2
00	USE0V1	Use audio channel 0 to modulate volume

```
        |       |             | of channel 1                                |
        +-------+-------------+---------------------------------------------+
```

Note: If both period and volume aremodulated on the same channel, the period and volume will be alternated. First AUDxDAT word is used for V6-V0 of AUDxVOL. Second AUDxDAT word is used for P15-P0 of AUDxPER. This alternating sequence is repeated.

1.7 AUDxLCH

```
NAME   rev ADDR type chip Description
-------------------------------------------------------------------------
AUDxLCH h 0A0    W   A    Audio channel x location (high 5 bits)
                          (old-3 bits)
```

1.8 AUDxLCL

```
NAME   rev ADDR type chip Description
-------------------------------------------------------------------------
AUDxLCL   0A2    W   A    Audio channel x location (low 15 bits)
```

This pair of registers contains the 20 bit starting address(location) of audio channel x (x=0,1,2,3)DMA data. This is not a pointer reg and therfore only needs to be reloaded if a diffrent memory location is to be outputted.

1.9 AUDxLEN

```
NAME   rev ADDR type chip Description
-------------------------------------------------------------------------
AUDxLEN   0A4    W   P    Audio channel x length
```

This reg contains the lentgh (number of words) of audio channel x DMA data.

1.10 AUDxPER

```
NAME   rev ADDR type chip Description
-------------------------------------------------------------------------
AUDxPER h 0A6    W   P    Audio channel x period
```

This reg contains the period (rate) of audio channel x DMA data transfer.
The minimum period is 124 clocks. This means that the smallest number that should be placed in this reg is 124.

1.11 AUDxVOL

```
NAME   rev ADDR type chip Description
-------------------------------------------------------------------------
AUDxVOL   0A8    W   P    Audio channel x volume
```

This reg contains the volume setting for audio channel x.
Bits 6,5,4,3,2,1,0 specify 65 linear volume levels as shown below.

BITS	USE
-15-07	Not used
06	Forces volume to max (64 ones,no zeros)
05-00	Sets one of the 64 levels (000000 = no output, 111111 = 63 ones, one zero)

1.12 AUDxDAT

```
NAME   rev ADDR type chip Description
-------------------------------------------------------------------------
AUDxDAT   0AA    W   P    Audio channel x data
```

This reg is the audio channel x (x=0,1,2,3) DMA data buffer. It contains 2 bytes of data (each byte is a twos complement signed integer) that are outputed sequentially (with digital to analog conversion)to the audio output pins. With maximum volume, each byte can drive the audio outputs with 0.8 volts(peak to peak,typ). The audio DMA channel controller automatically transfers data to this reg from RAM. The processor can also write directly to this reg. When the DMA data is finished (words outputted=lentgh)and the data in this reg has been used, an audio channel interrupt request is set.

1.13 BEAMCON0

```
NAME   rev ADDR type chip Description
-------------------------------------------------------------------------
BEAMCON0 h 1DC  W    A            Beam counter control bits
```

BIT#	FUNCTION
15	(unused)
14	HARDDIS
13	LPENDIS
12	VARVBEN
11	LOLDIS

	10	CSCBEN
	9	VARVSYEN
	8	VARHSYEN
	7	VARBEAMEN
	6	DUAL
	5	PAL
	4	VARCSYEN
	3	(unused, formerly BLANKEN)
	2	CSYTRUE
	1	VSYTRUE
	0	HSYTRUE

HARDDIS = This bit is used to disable the hardwire vertical horizontal window limits. It is cleared upon reset.

LPENDIS = When this bit is a low and LPE (BPLCON0,BIT 3) is enabled, the light-pen latched value(beam hit position) will be read by VHPOSR, VPOSR and HHPOSR. When the bit is a high the light-pen latched value is ignored and the actual beam counter position is read by VHPOSR, VPOSR, and HHPOSR.

VARVBEN = Use the comparator generated vertical blank (from VBSTRT, VBSTOP) to run the internal chip stuff-sending RGA signals to Denise, starting sprites,resetting light pen. It also disables the hard stop on the vertical display window.

LOLDIS = Disable long line/short toggle. This is useful for DUAL mode where even multiples are wanted, or in any single display where this toggling is not desired.

CSCBEN = The variable composite sync comes out on the HSY pin, and the variable conosite blank comes out on the VSY pin. The idea is to allow all the information to come out of the chip for a DUAL mode display. The normal monitor uses the normal composite sync, and the variable composite sync &blank come out the HSY & VSY pins. The bits VARVSTEN & VARHSYEN (below) have priority over this control bit.

VARVSYEN= Comparator VSY -> VSY pin. The variable VSY is set vertically on VSSTRT, reset vertically on VSSTOP, with the horizontal position for set set & reset HSSTRT on short fields (all fields are short if LACE = 0) and HCENTER on long fields (every other field if LACE = 1).

VARHSYEN= Comparator HSY -> HSY pin. Set on HSSTRT value, reset on HSSTOP value.

VARBEAMEN=Enables the variable beam counter comparators to operate (allowing diffrent beam counter total values) on the main horiz counter. It also disables hard display stops on both horizontal and vertical.

DUAL = Run the horizontal comparators with the alternate horizontal beam counter, and starts the UHRES pointer chain with the reset of this counter rather than the normal one. This allows the UHRES

pointers to come out more than once in a horizontal line, assuming there is some memory bandwidth left (it doesn't work in 640*400*4 interlace mode) also, to keep the two displays synced, the horizontal line lentghs should be multiples of each other. If you are amazingly clever, you might not need to do this.

PAL = Set appropriate decodes (in normal mode) for PAL. In variable beam counter mode this bit disables the long line/short line toggle- ends up short line.

VARCSYEN= Enables CSY from the variable decoders to come out the CSY (VARCSY is set on HSSTRT match always, and also on HCENTER match when in vertical sync. It is reset on HSSTOP match when VSY and on both HBSTRT & HBSTOP matches during VSY. A reasonable composite can be generated by setting HCENTER half a horiz line from HSSTRT, and HBSTOP at (HSSTOP-HSSTRT) before HCENTER, with HBSTRT at (HSSTOP-HSSTRT) before HSSTRT.
HSYTRUE, VSYTRUE, CSYTRUE = These change the polarity of the HSY*, VSY*, & CSY* pins to HSY, VSY, & CSY respectively for input & output.

1.14 BLTxPTH

NAME	rev	ADDR	type	chip	Description
BLTxPTH	h	050	W	A	Blitter Point to x (High 5 bits)

See also: BLTxPTL

1.15 BLTxPTL

NAME	rev	ADDR	type	chip	Description
BLTxPTL	h	052	W	A	Blitter Pointer to x (Low 15 bits)

This pair of registers (see also: BLTxPTH) contains the 20 bit address of Blitter source (X=A,B,C) or dest. (x=D) DMA data. This pointer must be preloaded with the starting address of the data to be processed by the blitter. After the Blitter is finished it will contain the last data address (plus increment and modulo).

1.16 BLTxMOD

NAME	rev	ADDR	type	chip	Description
BLTxMOD		064	W	A	Blitter Modulo x

This register contains the Modulo for Blitter source (x=A,B,C) or Dest (X=D). A Modulo is a number that is automatically

added to the address at the end of each line, in order that
the address then points to the start of the next line. Each
source or destination has it's own Modulo, allowing each
to be a different size, while an identical area of each is
used in the Blitter operation.

1.17 BLTAFWM

```
NAME   rev ADDR type chip Description
-------------------------------------------------------------------------------
BLTAFWM     044 W    A    Blitter first word mask for source A
```

See also: BLTALWM

1.18 BLTALWM

```
NAME   rev ADDR type chip Description
-------------------------------------------------------------------------------
BLTALWM    046  W    A    Blitter last word mask for source A
```

The patterns in these two registers (see also: BLTAFWM)
are "anded" with the first and last words of each line of data
from Source A into the Blitter. A zero in any bit overrides
data from Source A. These registers should be set to all
"ones" for fill mode or for line drawing mode.

1.19 BLTxDAT

```
NAME   rev ADDR type chip Description
-------------------------------------------------------------------------------
BLTxDAT    074  W    A    Blitter source x data reg.
```

This register holds Source x (x=A,B,C) data for use by the Blitter.
It is normally loaded by the Blitter DMA channel, however it
may also be preloaded by the microprocessor.

1.20 BLTDDAT

```
NAME   rev ADDR type chip Description
-------------------------------------------------------------------------------
BLTDDAT    000  W    A    Blitter destination data register
```

This register holds the data resulting from each word of
Blitter operation until it is sent to a RAM destination.
This is a dummy address and cannot be read by the micro.
The transfer is automatic during Blitter operation.

1.21 BLTSIZE

```
NAME   rev ADDR type chip Description
-------------------------------------------------------------------------------
BLTSIZE      058   W    A Blitter start and size (win/width, height)
```

This register contains the width and height of the blitter operation (in line mode width must = 2, height = line length). Writing to this register will start the Blitter, and should be done last, after all pointers and control registers have been initialized.

```
BIT# 15,14,13,12,11,10,09,08,07,06,05,04,03,02,01,00
     H9 H8 H7 H6 H5 H4 H3 H2 H1 H0 W5 W4 W3 W2 W1 W0
```

H=Height=Vertical lines (10 bits=1024 lines max)
W=Width=Horiz pixels (6 bits=64 words=1024 pixels max)

1.22 BLTCON0

```
NAME   rev ADDR type chip Description
-------------------------------------------------------------------------------
BLTCON0    040  W    A    Blitter control register 0
BLTCON0L H 05A  W    A    Blitter control register 0 (lower 8 bits)
                          This is to speed up software - the upper bits are
                          often the same.
BLTCON1  h 042  W    A    Blitter control register 1
```

These two control registers are used together to control blitter operations. There are 2 basic modes, are and line, which are selected by bit 0 of BLTCON1, as show below.

AREA MODE ("normal")			LINE MODE (line draw)		
BIT#	BLTCON0	BLTCON1	BIT#	BLTCON0	BLTCON1
15	ASH3	BSH3	15	ASH3	BSH3
14	ASH2	BSH2	14	ASH2	BSH2
13	ASH1	BSH1	13	ASH1	BSH1
12	ASA0	BSH0	12	ASH0	BSH0
11	USEA	0	11	1	0
10	USEB	0	10	0	0
09	USEC	0	09	1	0
08	USED	0	08	1	0
07	LF7	DOFF	07	LF7	DPFF
06	LF6	0	06	LF6	SIGN
05	LF5	0	05	LF5	OVF
04	LF4	EFE	04	LF4	SUD
03	LF3	IFE	03	LF3	SUL
02	LF2	FCI	02	LF2	AUL
01	LF1	DESC	01	LF1	SING
00	LF0	LINE(=0)	00	LF0	LINE(=1)

```
        ASH3-0    Shift value of A source
        BSH3-0    Shift value of B source and line texture
        USEA      Mode control bit to use source A
        USEB      Mode control bit to use source B
        USEC      Mode control bit to use source C
        USED      Mode control bit to use destination D
        LF7-0     Logic function minterm select lines
        EFE       Exclusive fill enable
        IFE       Inclusive fill enable
        FCI       Fill carry input
        DESC      Descending (dec address)control bit
        LINE      Line mode control bit
        SIGN      Line draw sign flag
        OVF       Line/draw r/l word overflow flag
        SUD       Line draw, Sometimes up or down (=AUD)
        SUL       Line draw, Sometimes up or left
        AUL       Line draw, Always up or left
        SING      line draw, Single bit per horiz line
        DOFF      Disables the D output- for external ALUs
                  The cycle occurs normally, but the data
                  bus is tristate (hires chips only)
```

1.23 BLTSIZH

```
NAME   rev ADDR type chip Description
-------------------------------------------------------------------------
BLTSIZH  h 05E  W    A    Blitter H size & start (11 bit width)

         BIT# 15 14 13 12 11 10  09 08 07 06 05 04 03 02 01 00
               x  x  x  x  x w10 w9 w8 w7 w6 w5 w4 w3 w2 w1 w0

         See also: BLTSIZV
```

1.24 BLTSIZV

```
NAME   rev ADDR type chip Description
-------------------------------------------------------------------------
BLTSIZV  h 05C  W    A    Blitter V size (15 bit height)

         BIT# 15  14  13  12  11  10  09 08 07 06 05 04 03 02 01 00
               x  h14 h13 h12 h11 h10 h9 h8 h7 h6 h5 h4 h3 h2 h1 h0

         These are the blitter size regs for blits larger than the earlier
         chips could accept. The original commands are retained for
         compatibility. BLTSIZV should be written first, followed by BLTSIZH,
         which starts the blitter. BLTSIZV need not be rewritten for
         subsequent bits if the vertical size is the same. Max size of
         blit 32k pixels * 32k lines, x's should be written to 0 for
         upward compatibility.
```

1.25 BPLHDAT

```
NAME   rev ADDR type chip Description
-------------------------------------------------------------------------------
BPLHDAT  h 07A  W         Ext logic UHRES bit plane identifier
```

This is the number (sign extended) that is added to the UHRES bitplane pointer (BPLHPTL,H) every line, and then another 2 is added, just like the other modulos.

1.26 BPLHMOD

```
NAME   rev ADDR type chip Description
-------------------------------------------------------------------------------
BPLHMOD  h 1E6  W    A    Uhres bit plane modulo
```

This is the number (sign extended) that is added to the UHRES bitplane pointer (BPLHPTL,H) every line, and then another 2 is added, just like the other modulos.

1.27 BPLHPTH

```
NAME   rev ADDR type chip Description
-------------------------------------------------------------------------------
BPLHPTH  h 1EC  W    A    UHRES (VRAM) bit plane pntr (high 5 bits)
```

When UHRES is enabled, this pointer comes out on the 2nd 'free' cycle after the start of each horizontal line. It's modulo is added every time it comes out. 'free' means priority above the copper and below the fixed stuff (audio,sprites....).
BPLHDAT comes out as an identifier on the RGA lines when the pointer address is valid so that external detectors can use this to do the special cycle for the VRAMs, The SHRHDAT gets the first and third free cycles.

1.28 BPLHPTL

```
NAME   rev ADDR type chip Description
-------------------------------------------------------------------------------
BPLHPTL  h 1EE  W    A    UHRES (VRAM) bit plane pntr (low 15 bits)
```

When UHRES is enabled, this pointer comes out on the 2nd 'free' cycle after the start of each horizontal line. It's modulo is added every time it comes out. 'free' means priority above the copper and below the fixed stuff (audio,sprites....).
BPLHDAT comes out as an identifier on the RGA lines when the pointer address is valid so that external detectors can use this to do the special cycle for the VRAMs, The SHRHDAT gets the first and third free cycles.

1.29 bplhstop

```
NAME   rev ADDR type chip Description
-------------------------------------------------------------------------------
BPLHSTOP p 1D6  W    A    UHRES bit plane vertical stop
```

BIT#	Name
15	BPLHWRM
14-11	Unused
10-0	V10-V0

BPLHWRM = Swaps the polarity of ARW* when the BPLHDAT comes out so that external devices can detect the RGA and put things into memory (ECS and later versions).

1.30 BPLHSTRT

```
NAME   rev ADDR type chip Description
-------------------------------------------------------------------------------
BPLHSTRT h 1D4  W   A           UHRES bit plane vertical stop
```

This controls the line when the data fetch starts for the BPLHPTH, L pointers. V10-V0 on DB10-0.

1.31 BPLxPTH

```
NAME   rev ADDR type chip Description
-------------------------------------------------------------------------------
BPLxPTH   0E0   W    A    Bit plane x pointer (high 5 bits)

          0E8            x=1,2,3,4,5,6,7,8
          0EC
          0F0
          0F4
        p 0F8
        p 0FC
```

1.32 BPLxPTL

```
NAME   rev ADDR type chip Description
-------------------------------------------------------------------------------
BPLxPTL    0E2  W    A    Bit plane pointer (low 15 bits)

           0EA        Address of bit plane x  (x=1,2,3,4,5,6,7,8) DMA data.
           0EE        This pointer must be reinitialized by the processor or
           0F2        coprocessor to point to the beginning of bit plane data
```

```
          0F6        every vertical blank time.
        p 0FA
        p 0FE
```

1.33 BPLxDAT

```
NAME   rev ADDR type chip Description
-------------------------------------------------------------------------
BPLxDAT   110  W    A           Bit plane x data (parallel to serial convert)

          112          These regs recieve the DMA data fetched from RAM by the
          114          bit plane address pointers described above.
          116          They may also be rewritten by either micro.
          118          they act as a 8 word parallel to serial buffer for up
          11A          to 8 memory 'bit planes'. x=1-8 the parallel to serial
        p 11C          conversion id triggered whenever bit plane #1 is
        p 11E          written, indicing the completion of all bit planes for
                       that word (16/32/64 pixels). The MSB is output first,
                       and is therefore always on the left.
```

1.34 BPLxMOD

```
NAME   rev ADDR type chip Description
-------------------------------------------------------------------------
BPL1MOD    108  W    A    Bit plane modulo (odd planes)
BPL2MOD    10A  W    A    Bit plane modulo (even planes)

         These registers contain the modulos for the odd and
         even bit planes. A modulo is a number that is automa-
         itcally added to the address at the end of each line,
         in order that the address then points to the start of
         the next line. Since they have seperate modulos, the
         odd and even bit planes may have sizes that are
         different from each other, as well as different from
         the display window size.
         If scan-doubling is enabled, BPL1MOD serves as the
         primary bitplane modulos and BPL2MOD serves as the
         alternate. Lines whose LSBs of beam counter and DIWSTRT
         match are designated primary, whereas lines whose LSBs
         don't match are designated alternate.
```

1.35 BPLCON0

```
NAME   rev ADDR type chip Description
-------------------------------------------------------------------------
BPLCON0 p  100  W    D    Bit plane control reg. (misc, control bits)

 +------+---------+-----------------------------------------------------+
 | BIT# | BPLCON0 | DESCRIPTION                                         |
 +------+---------+-----------------------------------------------------+
```

15	HIRES	HIRES = High resoloution (640*200/640*400 interlace) mode
14	BPU2	Bit plane use code 0000-1000 (NODE thru 8 inclusive)
13	BPU1	
12	BPU0	
11	HAM	Hold and modify mode, now using either 6 or 8 bit planes.
10	DPF	Double playfield (PFI=odd FP2= even bit planes) now available in all resoloutions. (If BPU=6 and HAM=0 and DPF=0 a special mode is defined that allows bitplane 6 to cause an intensity reduction of the other 5 bitplanes. The color register output selected by 5 bitplanes is shifted to half intensity by the 6th bit plane. This is called EXTRA-HALFBRITE Mode.
09	COLOR	Enables color burst output signal
08	GAUD	Genlock audio enable. This level appears on the ZD pin on denise during all blanking periods, unless ZDCLK bit is set.
07	UHRES	Ultrahi res enables the UHRES pointers (for 1k*1k) (also needs bits in DMACON (hires chips only). Disables hard stops for vert, horiz display windows.
06	SHRES	Super hi-res mode (35ns pixel width)
05	BYPASS=0	Bitplanes are scrolled and prioritized normally, but bypass color table and 8 bit wide data appear on R(7:0).
04	BPU3=0	See above (BPU0/1/2)
03	LPEN	Light pen enable (reset on power up)
02	LACE	Interlace enable (reset on power up)
01	ERSY	External resync (HSYNC, VSYNC pads become inputs) (reset on power up)
00	ECSENA=0	When low (default), the following bits in BPLCON3 are disabled: BRDRBLNK,BRDNTRAN,ZDCLKEN,BRDSPRT, and EXTBLKEN. These 5 bits can always be set by writing to BPLCON3, however there effects are inhibited until ECSENA goes high. This allows rapid context switching between pre-ECS viewports and new ones.

1.36 BPLCON1

NAME rev ADDR type chip Description

BPLCON1 p 102 W D Bit plane control reg. (horiz, scroll counter)

BIT#	BPLCON1	DESCRIPTION
15	PF2H7=0	(PF2Hx =) Playfield 2 horizontal scroll code, x=0-7
14	PF2H6=0	
13	PF2H1=0	
12	PF2H0=0	
11	PF1H7=0	(PF1Hx =) Playfield 1 horizontal scroll code, x=0-7
10	PF1H6=0	where PFyH0=LSB=35ns SHRES pixel (bits have been
09	PF1H1=0	renamed, old PFyH0 now PFyH2, ect). Now that the scroll
08	PF1H0=0	range has been quadrupled to allow for wider (32 or
		64 bits) bitplanes.

07	PF2H5	
06	PF2H4

1.37 BPLCON2

NAME	rev	ADDR	type	chip	Description
BPLCON2	p	104	W	D	Bit plane control reg. (new control bits)

BIT#	BPLCON2	DESCRIPTION
15	X	don't care- but drive to 0 for upward compatibility!
14	ZDBPSEL2	3 bit field which selects which bitplane is to be used for ZD when ZDBBPEN is set- 000 selects BB1 and 111 selects BP8.
13	ZDBPSEL1	
12	ZDBPSEL0	
11	ZDBPEN	Causes ZD pin to mirror bitplane selected by ZDBPSELx bits. This does not disable the ZD mode defined by ZDCTEN, but rather is "ored" with it.
10	ZDCTEN	Causes ZD pin to mirror bit #15 of the active entry in high color table. When ZDCTEN is reset ZD reverts to mirroring color (0).
09	KILLEHB	Disables extra half brite mode.
08	RDRAM=0	Causes color table address to read the color table instead of writing to it.
07	SOGEN=0	When set causes SOG output pin to go high
06	PF2PRI	Gives playfield 2 priority over playfield 1.
05	PF2P2	Playfield 2 priority code (with resp. to sprites).
04	PF2P1	
03	PF2P0	
02	PF1P2	Playfield 1 priority code (with resp. to sprites).
01	PF1P1	
00	PF1P0	

1.38 BPLTCON3

NAME	rev	ADDR	type	chip	Description
BPLCON3	p	106	W	D	Bit plane control reg. (enhanced features)

BIT#	BPLCON3	DESCRIPTION

15	BANK2=0	BANKx = Selects one of eight color banks, x=0-2.
14	BANK1=0	
13	BANK0=0	
12	PF2OF2=0	Determine bit plane color table offset when playfield 2 has priority in dual playfield mode:

PF20F			AFFECTED BITPLANE								OFFSET
2	1	0	8	7	6	5	4	3	2	1	(decimal)
0	0	0	-	-	-	-	-	-	-	-	none
0	0	1	-	-	-	-	-	-	1	-	2
0	1	0	-	-	-	-	-	1	-	-	4
0	1	1	-	-	-	-	-	1	-	-	8 (default)
1	0	0	-	-	-	1	-	-	-	-	16
1	0	1	-	-	1	-	-	-	-	-	32
1	1	0	-	1	-	-	-	-	-	-	64
1	1	1	1	-	-	-	-	-	-	-	128

11	PF2OF1=1	
10	PF2OF0=1	
09	LOCT=0	Dictates that subsequent color palette values will be written to a second 12- bit color palette, constituting the RGB low minus order bits. Writes to the normal hi monus order color palette automattically copied to the low order for backwards compatibility.
08	X	don't care- but drive to 0 for upward compatibility!
07	SPRES1=0	Determine resolution of all 8 sprites (x=0,1):

SPRES1	SPRES0	SPRITE RESOLUTION
0	0	ECS defaults (LORES,HIRES=140ns,SHRES=70ns)
0	1	LORES (140ns)
1	0	HIRES (70ns)
1	1	SHRES (35ns)

06	SPRES0=0	
05	BRDRBLNK=0	"Border area" is blanked instead of color (0). Disabled when ECSENA low.
04	BRDNTRAN=0	"Border area" is non minus transparant (ZD pin is low when border is displayed). Disabled when ECSENA low.
03	X	don't care- but drive to 0 for upward compatibility!
02	ZDCLKEN=0	ZD pin outputs a 14MHz clock whose falling edge coincides with hires (7MHz) video data. this bit when set disables all other ZD functions. Disabled when ESCENA low.
01	BRDSPRT=0	Enables sprites outside the display window. disabled when ESCENA low.
00	EXTBLKEN=0	Causes BLANK output to be programmable instead of reflecting internal fixed decodes. Disabled when ESCENA low.

08	BPLAM0=0	
07	ESPRM7=0	4 Bit field provides the 4 high order color table address bits for even sprites: SPR0,SPR2,SPR4,SPR6. Default value is 0001 binary. (x=7-4)
06	ESPRM6=0	
05	ESPRM5=0	
04	ESPRM4=1	
03	OSPRM7=0	4 Bit field provides the 4 high order color table address bits for odd sprites: SPR1,SPR3,SPR5,SPR7. Default value is 0001 binary. (x=7-4)
02	OSPRM6=0	
01	OSPRM5=0	
00	OSPRM4=1	

1.40 CLXCON

```
NAME   rev ADDR type chip Description
-------------------------------------------------------------------------------
CLXCON    098   W   A     Collision control
```

This register controls which bitplanes are included (enabled) in collision detection, and their required state if included. It also controls the individual inclusion of odd numbered sprites in the collision detection, by logically ORing them with their corresponding even numbered sprite. Writing to this register resets the bits in CLXCON2.

BIT#	FUNCTION	DESCRIPTION
15	ENSP7	Enable Sprite 7 (ORed with Sprite 6)

14	ENSP5	Enable Sprite 5 (ORed with Sprite 4)
13	ENSP3	Enable Sprite 3 (ORed with Sprite2)
12	ENSP1	Enable Sprite 1 (ORed with Sprite 0)
11	ENSP6	Enable bit plane 6 (match reqd. for collision
10	ENSP5	Enable bit plane 5 (match reqd. for collision
09	ENSP4	Enable bit plane 4 (match reqd. for collision
08	ENSP3	Enable bit plane 3 (match reqd. for collision
07	ENSP2	Enable bit plane 2 (match reqd. for collision
06	ENSP1	Enable bit plane 1 (match reqd. for collision
05	ENSP6	Match value for bit plane 6 collision
04	ENSP5	Match value for bit plane 5 collision
03	ENSP4	Match value for bit plane 4 collision
02	ENSP3	Match value for bit plane 3 collision
01	ENSP2	Match value for bit plane 2 collision
00	ENSP1	Match value for bit plane 1 collision

1.41 CLXCON2

NAME	rev	ADDR	type	chip	Description
CLXCON2	P	10C	W	D	Extended collision control

This reg controls when bit planes 7 and 8 are included in collision detection, and there required state if included. Contents of this register are reset by a write to CLXCON.

BITS INITIALIZED BY RESET

BIT#	FUNCTION	DESCRIPTION
15-08		unused
07	ENBP8	Enable bit plane 8 (match reqd. for collision)
06	ENBP7	Enable bit plane 7 (match reqd. for collision)
05-02		unused
01	MVBP8	Match value for bit plane 8 collision
00	MVBP7	Match value for bit plane 7 collision

Note: Disable bit planes cannot prevent collisions. Therefore if all bitplanes are disabled, collision will be continuous, regardless of the match values.

1.42 CLXDAT

NAME	rev	ADDR	type	chip	Description
CLXDAT		00E	R	D	Collision data reg. (read and clear)

This address reads (and clears) the collision detection reg. The bit assignments are below

Note: Playfield 1 is all odd numbered enabled bit planes.
Playfield 2 is all even numbred enabled bit planes.

BIT#	COLLISIONS REGISTERED
15	not used
14	Sprite 4 (or 5) to Sprite 6 (or 7)
13	Sprite 2 (or 3) to Sprite 6 (or 7)
12	Sprite 2 (or 3) to Sprite 4 (or 5)
11	Sprite 0 (or 1) to Sprite 6 (or 7)
10	Sprite 0 (or 1) to Sprite 4 (or 5)
09	Sprite 0 (or 1) to Sprite 2 (or 3)
08	Playfield 2 to Sprite 6 (or 7)
07	Playfield 2 to Sprite 4 (or 5)
06	Playfield 2 to Sprite 2 (or 3)
05	Playfield 2 to Sprite 0 (or 1)
04	Playfield 1 to Sprite 6 (or 7)
03	Playfield 1 to Sprite 4 (or 5)
02	Playfield 1 to Sprite 2 (or 3)
01	Playfield 1 to Sprite 0 (or 1)
00	Playfield 2 to Playfield 2

1.43 COLORx

NAME rev ADDR type chip Description

COLORxx 180-1BE W COLOR table xx

There 32 of these registers (xx=00-31) and together with the banking bits they address the 256 locations in the color palette. There are actually two sets of color regs, selection of which is controlled by the LOCT reg bit. When LOCT = 0 the 4 MSB of red, green and blue video data are selected along with the T bit for genlocks the low order set of registers is also selected as well, so that the 4 bits-values are automatically extended to 8 bits.This provides compatibility with old software. If the full range of palette values are desired, then LOCT can be set high and independant values for the 4 LSB of red, green and blue can be written. The low order color registers do not contain a transparency (T) bit.

The table below shows the color register bit usage.

BIT#	15,14,13,12	11,10,09,08	07,06,05,04	03,02,01,00
LOCT=0	T X X X	R7 R6 R5 R4	G7 G6 G5 G4	B7 B6 B5 B4
LOCT=1	X X X X	R3 R2 R1 R0	G3 G2 G1 G0	B3 B2 B1 B0

T = TRANSPARENCY, R = RED, G = GREEN, B = BLUE, X = UNUSED

T bit of COLOR00 thru COLOR31 sets ZD_pin HI, When that color is selected in all video modes.

1.44 COPCON

```
NAME   rev ADDR type chip Description
-------------------------------------------------------------------------
COPCON h  02E  W     A    Coproccessor control register
```

This is a-1 bit register that when set true, allows the coprocessor to access the blitter hardware. This bit is cleared power on reset, so that the coprocessor cannot access the blitter hardware.

BIT#	NAME	FUNCTION
01	CDANG	Coprocessor danger mode. Allows coprocessor access to all RGA registers if true. (if 0, access to RGA>7E) (On old chips access to only RGA>3E if CDANG=1) (see VPOSR)

1.45 COPJMP1

```
NAME   rev ADDR type chip Description
-------------------------------------------------------------------------
COPJMP1   088  S    A     Coprocessor restart at first location
```

See: COPJMP2

1.46 COPJMP2

```
NAME   rev ADDR type chip Description
-------------------------------------------------------------------------
COPJMP2   08A  S    A     Coprocessor restart at second location
```

These address are strobe address, that when written to cause the coprocessor to jump indirect useing the address contained in the first or second location regs described below. The coprocessor itself can write to these address, causeing it's own jump indirect.

1.47 COP1LCH

```
NAME   rev ADDR type chip Description
-------------------------------------------------------------------------
COP1LCH h 080  W    A         A Coprocessor first location reg
                                (high 5 bits) (old-3 bits)
COP1LCL   082  W    A         A Coprocessor first location reg
                                (low 15 bits)
COP2LCH h 084  W    A         A Coprocessor second location reg
                                (high 5 bits) (old-3 bits)
COP2LCL   086  W    A         A Coprocessor second location reg
                                (low 15 bits)
```

These regs contain the jump addresses described in COPINS

1.48 COPINS

```
NAME   rev ADDR type chip Description
-------------------------------------------------------------------------
COPINS    08C  W   A      Coprocessor inst. fetch identify
```

This is a dummy address that is generated by the coprocessor whenever it is loading instructions into its own instruction register. This actually occurs every coprocessor cycle except for the second (IR2) cycle of the MOVE instruction. The three types of instructions are shown below.

MOVE: Move immediate to dest

WAIT: Wait until beam counter is equal to, or greater than. (Keeps coprocessor off of bus until beam position has been reached)

SKIP: Skip if beam counter is equal to, or greater than. (Skips following MOVE inst. unless beam position has been reached)

	MOVE		WAIT UNTIL		SKIP IF	
BIT#	IR1	IR2	IR1	IR2	IR1	IR2
15	x	RD15	VP7	BFD	VP7	BFD
14	x	RD14	VP6	VE6	VP6	VE6
13	x	RD13	VP5	VE5	VP5	VE5
12	x	RD12	VP4	VE4	VP4	VE4
11	x	RD11	VP3	VE3	VP3	VE3
10	x	RD10	VP2	VE2	VP2	VE2
09	x	RD09	VP1	VE1	VP1	VE1
08	DA8	RD08	VP0	VE0	VP0	VE0
07	DA7	RD07	HP8	HE8	HP8	HE8
06	DA6	RD06	HP7	HE7	HP7	HE7
05	DA5	RD05	HP6	HE6	HP6	HE6
04	DA4	RD04	HP5	HE5	HP5	HE5
03	DA3	RD03	HP4	HE4	HP4	HE4
02	DA2	RD02	HP3	HE3	HP3	HE3

```
        | 01   | DA1 | RD01 | HP2 | HE2 | HP2 | HE2 |
        | 00   | 0   | RD00 | 1   | 0   | 1   | 1   |
        +------+-----+------+-----+-----+-----+-----+

        IR1=First instruction register
        IR2=Second insturction register
        DA =Destination address for MOVE instruction.Fetched during
            IR1 time,used during IR2 time on RGA bus.
        RD =RAM Data moved by MOVE instruction at IR2 time
            directly from RAM to the address given by the DA field.
        VP =Vertical beam position comparison bit.
        HP =Horizontal beam position comparison bit.
        VE =Enable comparison (mask bit)
        HE =Enable comparison (mask bit)

 * Note: BFD = Blitter finished disable. When this bit is true, the blitter
             finished flag will have no effect on the coprocessor. When this
             bit is zero the blitter finished flag must be true (in addition
             to the rest of the bit comparisons) before the coprocessor can
             exit from it's wait state, or skip over an instruction. Note
             that the V7 comparison cannot be masked.

        The coprocessor is basically a 2 cycle machine that requests
        the bus only during odd memory cycles. (4 memory cycles per in)

        It has priority over the blitter and micro.

        There are only three types of instructions, MOVE immediate,
        WAIT until ,and SKIP if. All instructions require 2 bus cycles
        (and two instruction words).Since only the odd bus cycles are
        requested, 4 memory cycle times are required per instruction.
        (memory cycles are 280 ns)

        There are two indirect jump registers COP1LC and COP2LC.
        These are 20 bit pointer registers whose contents are used to modify
        program counter for initalization or jumps.

        They are transfered to the program counter whenever strobe address
        COPJMP1 or COPJMP2 are written.In addition COP1LC is automatically
        used at the beginning of each vertical blank time.

        It is important that one of the jump registers be initalized and it's
        jump strobe address hit, after power up but before coprocessor DMA is
        initalized.T his insures a determined startup address, and state.
```

1.49 DDFSTRT

```
NAME   rev ADDR type chip Description
-------------------------------------------------------------------------
DDFSTRT  092  W  A  Display data fetch start(horiz. position)
DDFSTOP  094  W  A  Display data fetch stop (horiz. position)
  These registers control the horizontal timing of the beginning
  and end of the bit plane DMA timing display data fetch.
  The vertical bit plane DMA timing is identical to the display
  windows described above.
```

The bit plane Modulos are dependent on the bit plane horizontal size, and on this data fetch window size.

Register bit assignment

```
BIT# 15  14  13  12  11  10  09  08  07  06  05  04  03  02  01  00
USE  XX   X   X   X   X   X   X  H8  H7  H6  H5  H4  H3  H2   X
  (X bits should always be driven with 0 to maintain upward
   compatability)
```

The tables below show the start and stop timing for different register contents

DDFSTRT (Left edge of display data fetch)

PURPOSE	H8	H7	H6	H5	H4
Extra wide (max)	0	0	1	0	1
wide	0	0	1	1	0
normal	0	0	1	1	1
narrow	0	1	0	0	0

DDFSTOP (Right edge of display data fetch)

PURPOSE	H8	H7	H6	H5	H4
narrow	1	1	0	0	1
normal	1	1	0	1	0
wide (max)	1	1	0	1	1

Note that these numbers will vary with variable beam counter mode set: (The maxes and mins, that is)

1.50 DIWSTRT

```
NAME   rev ADDR type chip Description
-------------------------------------------------------------------------------
DIWSTRT 08E  W  A D   Display window start (upper left vert-hor pos)
DIWSTOP 090  W  A D   Display window stop (lower right vert-hor pos)
  These registers control the display window size and position,
  by locating the upper left and lower right corners.

  BIT# 15  14  13  12  11  10  09  08  07  06  05  04  03  02  01  00
  USE  V7  V6  V5  V4  V3  V2  V1  V0  H9  H8  H7  H6  H5  H4  H3  H2

  DIWSTRT is vertically restricted to the upper 2/3
  of the display (v8=0),and horizontally restricted to the
```

```
  left 3/4 of the display (H8=0).*
  * Poof.. (see DIWHIGH for exceptions)
```

1.51 DIWHIGH

```
NAME   rev ADDR type chip Description
-------------------------------------------------------------------------
DIWHIGH  p 1E4  W  A D Display window upper bits for start, stop
  This is an added register for Hires chips, and allows
  larger start & stop ranges. If it is not written, the above
  (DIWSTRT,STOP) description holds. If this register is written,
  direct start & stop positions anywhere on the screen.
  It doesn't affect the UHRES pointers.

  BIT# 15  14  13  12  11  10  09  08  07  06  05  04  03  02  01  00
       X   X  H10 H1  H0  V10 V9  V8   X   X  H10 H1  H0  V10 V9  V8
                     (stop)                 |         (start)

  Take care (X) bits should always be written to 0 to
  maintain upwards compatibility. H1 and H0 values define
  70ns amd 35ns increments respectively, and new LISA bits.

  Note: In all 3 display window registers, horizontal bit
  positions have been renamed to reflect HIRES pixel
  increments, e.g. what used to be called H0 is now referred to as H2.
```

1.52 DMACON

```
NAME   rev ADDR type chip Description
-------------------------------------------------------------------------
DMACON  096  W  A D P DMA control write (clear or set)
DMACONR 002  R  A   P DMA control (and blitter status) read

  This register controls all of the DMA channels, and contains
  blitter DMA status bits.
```

BIT#	FUNCTION	DESCRIPTION
15	SET/CLR	Set/Clear control bit. Determines if bits written wit a 1 get set or cleared. Bits written witn a zero are unchanged.
14	BBUSY	Blitter busy status bit (read only)
13	BZERO	Blitter logic zero status bit. (read only)
12	X	
11	X	
10	BLTPRI	Blitter DMA prioiry (over CPU micro) (also called "blitter nasty") (disables /BLS pin, preventing micro from stealing any bus cycles while blitter DMA is running)
09	DMAEN	Enable all DMA below (also UHRES DMA)

08	BPLEN	Bit plane DMA enable
07	COPEN	Coprocessor DMA enable
06	BLTEN	Blitter DMA enable
05	SPREN	Sprite DMA enable
04	DSKEN	Disk DMA enable
03	AUD3EN	Audio chanel 3 DMA enable
02	AUD2EN	Audio chanel 2 DMA enable
01	AUD1EN	Audio chanel 1 DMA enable
00	AUD0EN	Audio chanel 0 DMA enable

1.53 dskpth

NAME	rev	ADDR	type	chip	Description
DSKPTH	h	020	W	A	Disk pointer (high 5 bits) (old-3 bits)
DSKPTL		022	W	A	Disk pointer (low 15 bits)

This pair of registers contains the 20 bit address of disk DMA data. These address registers must be initalized by the processor or coprocessor before disk DMA is enabled.

1.54 DSKLEN

NAME	rev	ADDR	type	chip	Description
DSKLEN		024	W	P	Disk length

This register contains the length (number of words) of disk DMA data. It also contains 2 control bits. These are a DMA enable bit, and a DMA direction (read/write) bit.

BIT#	FUNCTION	DESCRIPTION
15	DMAEN	Disk DMA enable
14	WRITE	Disk write (RAM or disk) if 1
13-0	LENGTH	Length (# of words) of DMA data.

1.55 DSKDAT

NAME	rev	ADDR	type	chip	Description
DSKDAT		026	W	P	Disk DMA data write

1.56 DSKDATR

```
NAME   rev ADDR type chip Description
-------------------------------------------------------------------------
DSKDATR 008 ER   P  Disk DMA  data read (early read dummy address)
```

This register is the disk-DMA data buffer.It contains 2 bytes of data that are either sent to (write) or received from (read) the disk. The DMA controller automatically transfers data to or from this register and RAM, and when the DMA data is finished (length=0) it causes a disk block interrupt. See interrupts below.

1.57 DSKBYTR

```
NAME   rev ADDR type chip Description
-------------------------------------------------------------------------
DSKBYTR 01A  R  p Disk data byte and status read
```

This register is the Disk-Microrocessor data buffer. Data from the disk (in read mode) is leaded into this register one byte at a time, and bit 15 (DSKBYT) is set true.

BIT#	FUNCTION	DESCRIPTION
15	DSKBYT	Disk byte ready (reset on read)
14	DMAON	DMAEN (DSKLEN) & DMAEN (DMACON) & DSKEN (DMACON)
13	DISKWRITE	Mirror of bit 14 (WRITE) in DSKLEN
12	WORDEQUAL	This bit true only while DSKSYNC register equals the data from disk
11-08	0	Not used
07-00	DATA	Disk byte data

1.58 DSKSYNC

```
NAME   rev ADDR type chip Description
-------------------------------------------------------------------------
DSKSYNC  07E W    P Disk sync register,the match code for disk
              read synchronization. See ADKCON bit 10
```

1.59 FMODE

```
NAME   rev ADDR type chip Description
-------------------------------------------------------------------------
FMODE P  1FC W      Memory Fetch Mode
    This register controls the fetch mechanism for different
    types of Chip RAM accesses:
```

BIT#	FUNCTION	DESCRIPTION
15	SSCAN2	Global enable for sprite scan-doubling.
14	BSCAN2	Enables the use of 2nd P/F modulus on an alternate line basis to support bitplane scan-doubling.
13-04	Unused	
03	SPAGEM	Sprite page mode (double CAS)
02	SPR32	Sprite 32 bit wide mode
01	BPAGEM	Bitplane Page Mode (double CAS)
00	BLP32	Bitplane 32 bit wide mode

BPAGEM	BPL32	Bitplane Fetch	Increment	Memory Cycle	Bus Width
0	0	By 2 bytes	(as before)	normal CAS	16
0	1	By 4 bytes		normal CAS	32
1	0	By 4 bytes		double CAS	16
1	1	By 8 bytes		double CAS	32

SPAGEM	SPR32	Sprite Fetch	Increment	Memory Cycle	Bus Width
0	0	By 2 bytes	(as before)	normal CAS	16
0	1	By 4 bytes		normal CAS	32
1	0	By 4 bytes		double CAS	16
1	1	By 8 bytes		double CAS	32

1.60 HBSTOP

```
NAME   rev ADDR type chip Description
-------------------------------------------------------------------------
HBSTOP 1C6 W  D    Horizontal STOP position
HBSTRT 1C4 W  D    Horizontal START position
```

Bits 7-0 contain the stop and start positions, respectively, for programed horizontal blanking in 280nS increments.Bits 10-8 provide a fine position control in 35nS increments.

BIT#	FUNCTION	DESCRIPTION
15-11	x	(unused)
10	H1	140nS
09	H1	70nS
08	H0	35nS
07	H10	35840nS
06	H9	17920nS

```
        | 05    |  H8      | 8960nS       |
        | 04    |  H7      | 4480nS       |
        | 03    |  H6      | 2240nS       |
        | 02    |  H5      | 1120nS       |
        | 01    |  H4      | 560nS        |
        | 00    |  H3      | 280nS        |
        +-------+----------+--------------+
```

1.61 HCENTER

```
NAME   rev ADDR type chip Description
-------------------------------------------------------------------------
HCENTER H 1E2  W  A  Horizontal position (CCKs) of VSYNC on long field

   this is necessary for interlace mode with variable beam
   counters. See BEAMCON0 for when it affects chip outputs.
   See HTOTAL for bits.
```

1.62 HHPOSR

```
NAME   rev ADDR type chip Description
-------------------------------------------------------------------------
HHPOSR  H 1DA  R  A  DUAL mode hires Hbeam counter read
HHPOSW  H 1D8  W  A  DUAL mode hires Hbeam counter write

  This the secondary beam counter for
  the faster mode, triggering the UHRES pointers & doing the
  comparisons for HBSTRT, STOP, HTOTAL, HSSRT, HSSTOP
  (See HTOTAL for bits)
```

1.63 HSSTOP

```
NAME   rev ADDR type chip Description
-------------------------------------------------------------------------
HSSTOP H  1C2  W  A   Horiz line position for SYNC stop

    Sets # of colour clocks for sync stop (HTOTAL for bits)
```

1.64 HSSTRT

```
NAME   rev ADDR type chip Description
-------------------------------------------------------------------------
HSSTRT H  1DE  W  A  Horiz line position for HSYNC stop

    Sets # of colour clocks for sync start (HTOTAL for bits)
    See BEAMCON0 for details of when these 2 are active.
```

1.65 HTOTAL

```
NAME   rev ADDR type chip Description
-------------------------------------------------------------------------------
HTOTAL H  1C0  W  A    Highest colour clock count in horiz line

  BIT#  15  14  13  12  11  10  09  08  07  06  05  04  03  02  01  00
        x   x   x   x   x   x   x   x  h8  h7  h6  h5  h4  h3  h2  h1

  (x's should be driven to 0 for upward compatibility)
  Horiz line has theis many + 1 280nS increments. If the
  pal bit & LOLDIS are not high, long line/skort line toggle
  will occur, and there will be this many +2 every other line.
  Active if VARBEAMEN=1 or DUAL+1.
```

1.66 INTREQ

```
NAME   rev ADDR type chip Description
-------------------------------------------------------------------------------
INTREQ   09C  W         P Interrupt request bits (clear or set)
INTREQR  01E  R         P Interrupt request bits (read)

  This register contains interrupt request bits (or flags).
  These bits may be polled by the processor, and if enabled
  by the bits listed in the next register, they may cause
  processor interrupts. Both a set and clear operation
  are required to load arbitary data into this register.
  The bit assignments are identical to the enable register
  below.
```

1.67 INTENA

```
NAME   rev ADDR type chip Description
-------------------------------------------------------------------------------
INTENA   09A  W      P Interrupt enable bits (clear or set bits)
INTENAR  01C  R        P Interrupt enable bits (read)

  This register contains interrupt enable bits. The bit
  assignment for both the request, and enable registers
  is given below.

 +------+----------+-------+-------------------------------------------+
 | BIT# | FUNCTION | LEVEL | DESCRIPTION                               |
 +------+----------+-------+-------------------------------------------+
 | 15   |  SET/CLR |       | Set/clear control bit. Determines if bits  |
 |      |          |       | written with a 1 get set or cleared. Bits  |
 |      |          |       | written with a zero are always unchanged.  |
 | 14   |  INTEN   |       | Master interrupt (enable only, no request) |
 | 13   |  EXTER   |   6   | External interrupt                         |
 | 12   |  DSKSYN  |   5   | Disk sync register (DSKSYNC) matches disk  |
 | 11   |  RBF     |   5   | Serial port receive buffer full            |
```

10	AUD3	4	Audio channel 3 block finished
09	AUD2	4	Audio channel 2 block finished
08	AUD1	4	Audio channel 1 block finished
07	AUD0	4	Audio channel 0 block finished
06	BLIT	3	Blitter has finished
05	VERTB	3	Start of vertical blank
04	COPER	3	Coprocessor
03	PORTS	2	I/O Ports and timers
02	SOFT	1	Reserved for software initated interrupt.
01	DSKBLK	1	Disk block finished
00	TBE	1	Serial port transmit buffer empty

1.68 JOYxDAT

```
NAME   rev ADDR type chip Description
-------------------------------------------------------------------------------
JOY0DAT  00A R     D   Joystick-mouse 0 data (left vert, horiz)
JOY1DAT  00C R     D   Joystick-mouse 1 data (right vert,horiz)
```

These addresses each read a 16 bit register. These in turn are loaded from the MDAT serial stream and are clocked in on the rising edge of SCLK. MLD output is used to parallel load the external parallel-to-serial converter.This in turn is loaded with the 4 quadrature inputs from each of two game controller ports (8 total) plus 8 miscellaneous control bits which are new for LISA and can be read in upper 8 bits of LISAID.
Register bits are as follows:
Mouse counter usage (pins 1,3 =Yclock, pins 2,4 =Xclock)

BIT#	15	14	13	12	11	10	09	08	07	06	05	04	03	02	01	00
JOY0DAT	Y7	Y6	Y5	Y4	Y3	Y2	Y1	Y0	X7	X6	X5	X4	X3	X2	X1	X0
JOY1DAT	Y7	Y6	Y5	Y4	Y3	Y2	Y1	Y0	X7	X6	X5	X4	X3	X2	X1	X0

0=LEFT CONTROLLER PAIR, 1=RIGHT CONTROLLER PAIR.
(4 counters total).The bit usage for both left and right addresses is shown below. Each 6 bit counter (Y7-Y2,X7-X2) is clocked by 2 of the signals input from the mouse serial stream. Starting with first bit recived:

Serial	Bit Name	Description
0	M0H	JOY0DAT Horizontal Clock
1	M0HQ	JOY0DAT Horizontal Clock (quadrature)
2	M0V	JOY0DAT Vertical Clock
3	M0VQ	JOY0DAT Vertical Clock (quadrature)
4	M1V	JOY1DAT Horizontall Clock
5	M1VQ	JOY1DAT Horizontall Clock (quadrature)
6	M1V	JOY1DAT Vertical Clock
7	M1VQ	JOY1DAT Vertical Clock (quadrature)

Bits 1 and 0 of each counter (Y1-Y0,X1-X0) may be
read to determine the state of the related input signal pair.
This allows these pins to double as joystick switch inputs.
Joystick switch closures can be deciphered as follows:

Directions	Pin#	Counter bits
Forward	1	Y1 xor Y0 (BIT#09 xor BIT#08)
Left	3	Y1
Back	2	X1 xor X0 (BIT#01 xor BIT#00)
Right	4	X1

1.69 JOYTEST

NAME rev ADDR type chip Description

JOYTEST 036 W D Write to all 4 joystick-mouse counters at once.

Mouse counter write test data:

BIT#	15	14	13	12	11	10	09	08	07	06	05	04	03	02	01	00
JOY0DAT	Y7	Y6	Y5	Y4	Y3	Y2	xx	xx	X7	X6	X5	X4	X3	X2	xx	xx
JOY1DAT	Y7	Y6	Y5	Y4	Y3	Y2	xx	xx	X7	X6	X5	X4	X3	X2	xx	xx

1.70 LISAID

NAME rev ADDR type chip Description

LISAID H 07C R D Denise/Lisa (video out chip) revision level

The original Denise (8362) does not have this register, so
whatever value is left over on the bus from the last cycle
will be there. ECS Denise (8373) returns hex (fc) in the lower
8 bits.Lisa returns hex (f8). The upper 8 bits of this
Register are loaded from the serial mouse bus, and are
reserved for future hardware implentation.

The 8 low-order bits are encoded as follows:

BIT#	Description
7-4	Lisa/Denise/ECS Denise Revision level(decrement to bump revision level, hex F represents 0th rev. level).
3	Maintain as a 1 for future generation
2	When low indicates AA feature set (LISA)
1	When low indicates ECS feature set (LISA or ECS DENISE)
0	Maintain as a 1 for future generation

1.71 POTxDAT

```
NAME   rev ADDR type chip Description
-------------------------------------------------------------------------------
POT0DAT h  012  R       P  Pot counter data left pair (vert, horiz)
POT1DAT h  014  R       P  Pot counter data right pair (vert,horiz)
```

These addresses each read a pair of 8 bit pot counters. (4 counters total). The bit assignment for both addresses is shown below. The counters are stopped by signals from 2 controller connectors (left-right) with 2 pins each.

BIT#	15	14	13	12	11	10	09	08	07	06	05	04	03	02	01	00
RIGHT	Y7	Y6	Y5	Y4	Y3	Y2	Y1	Y0	X7	X6	X5	X4	X3	X2	X1	X0
LEFT	Y7	Y6	Y5	Y4	Y3	Y2	Y1	Y0	X7	X6	X5	X4	X3	X2	X1	X0

CONNECTORS				PAULA
Loc.	Dir.	Sym	pin	pin
RIGHT	Y	RX	9	33
RIGHT	X	RX	5	32
LEFT	Y	LY	9	36
LEFT	X	LX	5	35

With normal (NTSC or PAL) horiz. line rate, the pots will give a full scale (FF) reading with about 500kohms in one frame time. With proportionally faster horiz line times, the counters will count proportionally faster. This should be noted when doing variable beam displays.

1.72 POTGO

```
NAME   rev ADDR type chip Description
-------------------------------------------------------------------------------
POTGO  034 W      P   Pot port (4 bit) bi-direction and data,
                      and pot counter start.
```

1.73 POTINP

```
NAME   rev ADDR type chip Description
-------------------------------------------------------------------------------
POTINP 016 R      P Pot pin data read
```

This register controls a 4 bit bi-direction I/O port that shares the same 4 pins as the 4 pot counters above.

BIT#	FUNCTION	DESCRIPTION

15	OUTRY	Output enable for Paula pin 33
14	DATRY	I/O data Paula pin 33
13	OUTRX	Output enable for Paula pin 32
12	DATRX	I/O data Paula pin 32
11	OUTLY	Out put enable for Paula pin 36
10	DATLY	I/O data Paula pin 36
09	OUTLX	Output enable for Paula pin 35
08	DATLX	I/O data Paula pin 35
07-01	X	Not used
00	START	Start pots (dump capacitors,start counters)

1.74 REFPTR

NAME	rev	ADDR	type	chip	Description
REFPTR		028	W	A	Refresh pointer

This register is used as a dynamic RAM refresh address generator. It is writeable for test purposes only,and should never be written by the microprocesor.

1.75 SERDAT

NAME	rev	ADDR	type	chip	Description
SERDAT		030	W	P	Serial port data and stop bits write.

This address writes data to a transmit data buffer. Data from this buffer is moved into a serial shift register for output transmission whenever it is empty.This sets the interrupt request TBE (transmit buffer empty). A stop bit must be provided as part of the data word. The length of the data word is set by the position of the stop bit.

BIT#	15	14	13	12	11	10	09	08	07	06	05	04	03	02	01	00
USE	0	0	0	0	0	0	S	D8	D7	D6	D5	D4	D3	D2	D1	D0

Note : S= Stop bit =1, D= data bits

1.76 SERDATR

NAME	rev	ADDR	type	chip	Description
SERDATR		018	R	P	Serial port data and status read.

This address reads data from a recive data buffer. Data in this buffer is loaded from a receiving shift register whenever it is full. Several interrupt request

bits are also read at this address, along with the data as shown below.

BIT#	FUNCTION	DESCRIPTION
15	OVRUN	Serial port receiver overun
14	RBF	Serial port receive buffer full (mirror)
13	TBE	Serial port transmit buffer empty (mirror)
12	TSRE	Serial port transmit shift reg. empty
11	RXD	RXD pin receives UART serial data for direct bit test by the micro.
10	X	Not used.
09	STP	Stop bit
08	STP-DB8	Stop bit if LONG, data bit if not.
07	DB7	Data bit.
06	DB6	Data bit.
05	DB5	Data bit.
04	DB4	Data bit.
03	DB3	Data bit.
02	DB2	Data bit.
01	DB1	Data bit.
00	DB0	Data bit.

1.77 SERPER

NAME	rev	ADDR	type	chip	Description
SERPER		032	W	P	Serial port period and control.

This register contains the control bit LONG reffered to above, and a 15 bit number defining the serial port Baud rate.If this number is N,then the baud rate is 1 bit every (N+1)*.2794 microseconds.

BIT#	FUNCTION	DESCRIPTION
15	LONG	Defines serial receive as 9 bit word.
14-00	RATE	Defines baud rate=1/((N+1)*.2794 microseconds)

1.78 SPRHDAT

NAME	rev	ADDR	type	chip	Description
SPRHDAT	H	078	W	exe	logic UHRES sprite identifier and data

This identifies the cycle when this pointer address is on the bus accessing the memory.

1.79 SPRHPTH

```
NAME   rev ADDR type chip Description
-------------------------------------------------------------------------------
SPRHPTH  H  1E8  W   A    UHRES sprite pointer (high 5 bits)
SPRHPTL  H  1EA  W   A    UHRES sprite pointer (low 15 bits)
```

This pointer is activated in the 1st and 3rd ‘free‘ cycles (see BPLHPTH,L) after horiz line start.It increments for the next line.

1.80 SPRHSTOP

```
NAME   rev ADDR type chip Description
-------------------------------------------------------------------------------
SPRHSTOP H 1D2  W    A    UHRES sprite vertical display stop

    BIT#  15  14  13  12  11  10  09  08     07  06  05  04  03  02  01  00
SPRHWRM   x   x   x   x   x  v10  v9  v8     v7  v6  v5  v4  v3  v2  v1  v0
```

SPRHWRM = Swaps the polarity of ARW* when the SPRHDAT comes out so that external devices can detect the RGA and put things into memory.(ECS and later chips only)

1.81 SPRHSTRT

```
NAME   rev ADDR type chip Description
-------------------------------------------------------------------------------
SPRHSTRT H 1D0  W   A     UHRES sprite vertical display start

 BIT#  15  14  13  12  11  10  09  08     07  06  05  04  03  02  01  00
        x   x   x   x   x  v10 v9  v8     v7  v6  v5  v4  v3  v2  v1  v0
```

1.82 SPRxPTH

```
NAME   rev ADDR type chip Description
-------------------------------------------------------------------------------
SPRxPTH    120  W    A      Sprite x pointer (High 5 bits)
SPRxPTL    122  W    A      Sprite x pointer (low 15 bits)
```

This pair of registers contains the 20 bit address of sprite x (x=0,1,2,3,4,5,6,7) DMA data.These address registers must be initalized by the processor or coprocessor every vertical blank time.

1.83 sprxpos

```
NAME   rev ADDR type chip Description
-------------------------------------------------------------------------
SPRxPOS   140   W    A  D   Sprite x vert-horiz start position data.
```

BIT#	SYM	FUNCTION
15-08	SV7-SV0	Start vertical value.High bit (SV8) is in SPRxCTL register below.
07-00	SH10-SH3	Sprite horizontal start value. Low order 3 bits are in SPRxCTL register below. If SSCAN2 bit in FMODE is set, then disable SH10 horizontal coincidence detect.This bit is then free to be used by ALICE as an individual scan double enable.

1.84 sprxctl

```
NAME   rev ADDR type chip Description
-------------------------------------------------------------------------
SPRxCTL p 142 W     A  D   Sprite position and control data
```

BIT#	SYM	FUNCTION
15-08	EV7-EV0	End (stop) vert. value. Low 8 bits
07	ATT	Sprite attach control bit (odd sprites only)
06	SV9	Start vert value 10th bit.
05	EV9	End (stop) vert. value 10th bit
04	SH1=0	Start horiz. value, 70nS increment
03	SH0=0	Start horiz. value 35nS increment
02	SV8	Start vert. value 9th bit
01	EV8	End (stop) vert. value 9th bit
00	SH2	Start horiz.value,140nS increment

These 2 registers work together as position, size and feature sprite control registers.They are usually loaded by the sprite DMA channel, during horizontal blank, however they may be loaded by either processor any time. Writing to SPRxCTL disables the corresponding sprite.

1.85 SPRxDAT

```
NAME   rev ADDR type chip Description
-------------------------------------------------------------------------
SPRxDATA  144  W      D    Sprite x image data register A
SPRxDATB  146  W      D    Sprite x image data register B
```

These registers buffer the sprite image data.They are
usually loaded by the sprite DMA channel but may be
loaded by either processor at any time. When a horizontal
coincidence occurs the buffers are dumped into shift
registers and serially outputed to the display, MSB first
on the left.
NOTE: Writing to the A buffer enables (arms) the sprite.
Writing to the SPRxCTL registers disables the sprite.
If enabled, data in the A and B buffers will be output
whenever the beam counter equals the sprite horizontal
position value in the SPRxPOS register. In lowres mode,
1 sprite pixel is 1 bitplane pixel wide.In HRES and
SHRES mode, 1 sprite pixel is 2 bitplane pixels.
The DATB bits are the 2SBs (worth 2) for the color registers,
and MSB for SHRES. DATA bits are LSBs of the pixels.

1.86 STREQU

NAME	rev	ADDR	type	chip	Description
STREQU		038	S	D	Strobe for horiz sync with VB (vert blank) and EQU
STRVBL		038	S	D	Strobe for horiz sync with VB
STRHOR		03C	S	D P	Strobe for horiz sync
STRLONG	h	03E	S	D	Strobe for identification of long horiz line (228CC)

One of the first 3 strobe addresses above, it is
placed on the RGA bus during the first refresh time
slot of every other line, to identify lines with
long counts (228- NTSC, HTOTAL+2- VARBEAMEN=1
hires chips only).There are 4 refresh time slots
and any not used for strobes will leave a null
(1FE) address on the RGA bus.

1.87 vbstop

NAME	rev	ADDR	type	chip	Description
VBSTOP	H	1CE	W	A	Vertical line for VBLANK stop
VBSRTR	H	1CC	W	A	Vertical line for VBLANK start

(V10-0 <- D10-0) Affects CSY pin if BLAKEN=1 and VSY pin
if CSCBEN=1 (see BEAMCON0)

1.88 VPOSR

NAME	rev	ADDR	type	chip	Description
VPOSR	p	004	R	A	Read vert most sig. bits (and frame flop)
VPOSW		02A	W	A	Write most sig. bits (and frame flop)

```
 BIT#  15  14  13  12  11  10  09  08     07  06  05  04  03  02  01  00
 USE LOF   I6  I5  I4  I3  I2  I1  I0 LOL --  --  --  --  --  V10 V9  V8

         LOF = Long frame(auto toggle control bit in BPLCON0)

         I0-I6 Chip identitication:

         8361 (Regular) or 8370 (Fat) (Agnus-ntsc) = 10
         8367 (Pal) or 8371 (Fat-Pal) (Agnus-pal)  = 00
         8372 (Fat-hr) (agnushr),thru rev4         = 20 Pal, 30 NTSC
         8372 (Fat-hr) (agnushr),rev 5             = 22 Pal, 31 NTSC
         8374 (Alice) thru rev 2                   = 22 Pal, 32 NTSC
         8374 (Alice) rev 3 thru rev 4             = 23 Pal, 33 NTSC

         LOL = Long line bit. When low, it indicates short raster line.
         v9,10 -- hires chips only (20,30 identifiers)
```

1.89 VHPOSR

```
NAME   rev ADDR type chip Description
-------------------------------------------------------------------------
VHPOSR     006  R   A    Read vert and horiz position of beam, or lightpen
VHPOSW     02C  W   A    Write vert horiz position of beam, or lightpen
 BIT#  15  14  13  12  11  10  09  08     07  06  05  04  03  02  01  00
 USE   V7  V6  V5  V4  V3  V2  V1  V0     H8  H7  H6  H5  H4  H3  H2  H1

    RESOLUTION = 1/160 of SCREEN WITH ( 280 nS)
```

1.90 VSSTOP

```
NAME   rev ADDR type chip Description
-------------------------------------------------------------------------
VSSTOP H   1CA W   A   Vert position for VSYNC start
VTOTAL H   1C8 W   A   Highest numbered vertival line (VARBEAMEN = 1)

  It's the line number to reset the counter,
  so there's this many + 1 in a field. The exception is
  if the LACE bit is set (BPLCON0), in which case every
  other field is this many + 2 and the short field is this
  many + 1.
```

1.91 lisamodes

```
5. New LISA Display Modes

        We now have a palette of 2~24 colours.

        LORES  (320x200)
        ----------------
```

```
6 Bitplane (non HAM, non EHB)   64 colours      !
7 Bitplane                      128 colours                    !
8 Bitplane                      256 colours                    !
8 Bitplane HAM                  Any 2^24 colours               !

Dual playfield, Max 4 bitplane per playfield. 16 colours       !
per playfield. The bank of 16 colours in the 256 colour palette
is selectable per playfield.

HIRES  (640x200)
----------------

5 Bitplanes             32 colours       @
6 Bitplanes             64 colours                            @
7 Bitplanes             128 colours                           @
8 Bitplanes             256 colours                           @
6 Bitplanes EHB         32 * 2 colours                        @
6 Bitplanes HAM         4096 colours                          @
8 Bitplanes HAM         any of 2^24 colours                   @

Dual playfield, max 4 bitplane per playfield 16 colours per    ! or @
playfield. The bank of 16 colours in the 256 colour palette
is selectable per playfield.

SUPERHIRES (1280X200)
---------------------

1 or 2 bitplanes, as ECS, but no colour fudging     !
3 Bitplanes   8 colours       @
4 Bitplanes   16 colours        @
5 Bitplanes   32 colours        $
6 Bitplanes   64 colours        $
7 Bitplanes   128 colours       $
8 Bitplanes   256 colours       $
6 Bitplanes EHB         32 * 2 colours        $
6 Bitplanes HAM   4096 colours        $
8 Bitplanes HAM         any of 2~24 colours     $

Dual Playfield, max 4 bitplanes per playfield     @ or $
16 colours per playfield. The bank of 16 of colours
in the 256 colours palette is selectable per playfield.

VGA  (640X480 non-interlaced)
-----------------------------

1 or 2 bitplanes, as ECS, but no colour fudging     !
3 Bitplanes   8 colours       @
4 Bitplanes   16 colours        @
5 Bitplanes   32 colours        $
6 Bitplanes   64 colours        $
7 Bitplanes   128 colours       $
8 Bitplanes   256 colours       $
6 Bitplanes EHB         32 * 2 colours        $
6 Bitplanes HAM   4096 colours        $
8 Bitplanes HAM         any of 2~24 colours     $
```

Dual playfield,Max 4 bitplanes per playfield @ or $
16 colours per playfield . The bank of 16 colours
in the 256 colour palette is selectable per playfield

Super 72 (848x614 interlaced, 70 Hz frame rate)
---

1 or 2 bitplanes, as ECS, but no colour fudging		1X
3 Bitplanes	8 colours	2X
4 Bitplanes	16 colours	2X
5 Bitplanes	32 colours	4X
6 Bitplanes	64 colours	4X
7 Bitplanes	128 colours	4X
8 Bitplanes	256 colours	4X
6 Bitplanes EHB	32 * 2 colours	4X
6 Bitplanes HAM	4096 colours	4X
8 Bitplanes HAM	any of 2~24 colours	4X

Dual playfield,Max 4 bitplanes per playfield 2X or 4X
16 colours per playfield . The bank of 16 colours
in the 256 colour palette is selectable per playfield

All playfield scrolling is now in 35ns increments.
Pre AA scrolling was in 140ns increments.

Scroll Range as Programmed in BPLCON1

1X Modes	LORES Pixels	SHRES Pixels
LORES	0-15	0-63
HIRES	0-7	0-31
SHRES	0-3	0-15

2X Modes	LORES Pixels	SHRES Pixels
LORES	0-31	0-127
HIRES	0-15	0-63
SHRES	0-7	0-31

4X Modes	LORES Pixels	SHRES Pixels
LORES	0-63	0-255
HIRES	0-31	0-127
SHRES	0-15	0-63

Sprites

All sprites can now be displayed in either:

1) ECS default mode
2) 140 ns (this is not ECS mode!)
3) 70 ns
4) 35 ns

on display resolution. eg 35 ns sprites on a lores screen, or 140 ns sprites on a superhires screen.

Sprites are either 16, 32, or 64 bits wide.

Sprites can be attatched in any mode (formerly could not attach sprites in the ECS SHRES 35ns resolution mode).

Can use any bank of 16 colours from the 256 colour palette for the sprite colours.

Key:

! needs 1x Bandwidth (old modes)
@ needs 2x Bandwidth (normal CAS 32bit bus with or double CAS 16 bit bus width)
$ needs 4x Bandwidth (double CAS 32bit bus width)
