Chapter 1

07b346b0-0

1.1 Main

Time

a blanker module for SwazBlanker

FreeWare

Copyright © 1995 Marcel Offermans

~Introduction~ What does this blanker module do?
~Interface~~~~ How to manipulate the various settings.
~History~~~~~ Updates and bug fixes.
~Background~~ About the program and its author.

1.2 Introduction

Introduction

The time blanker module shows a black screen with a digital clock. The clock shows hours, minutes and seconds. After a configurable amount of time, the clock jumps to a different randomly chosen position.

1.3 Interface

Interface

The user interface contains two sliders at the top of the window. They are used to set the update time and the jump time. The update time is the time that the blanker module waits before updating the clock. Normally, you should set it to about one second (9 / 10 or 10 / 10 seconds). The jump time is the

time that the blanker module waits before moving the clock to a newly chosen random position.

Below these sliders you can find the screenmode and the font buttons. These are used to set the screenmode and the font used for the clock respectively. Their use is pretty self explanatory.

At the bottom of the screen are four additional buttons. With use you can change the settings temporarily (until you reboot) and with save you can store the settings on disk. Test allows you to immediately see the effects of any changes you just made. Finally, cancel undoes all changes and reverts to the previous used settings.

1.4 History

History

1.0 This is the first version that was released.

1.5 Background

Background

The idea for this module came when I was betatesting one of the earlier versions of SwazBlanker. I missed a blanker module that showed the time on screen.

Thanks must go to David for his support while I was writing the blanker module.
