Hi,
I have an old Commodore 64. But when i switch on, i see that i only have 926 bytes free
(normally: 38944 bytes).
Then i cannot use any programs.
I have opened my commodore, but i dont know which chip is not "working" anymore !
How can i repair it or what can i do to give memory to my computer ?

You can send my your advice to my adress.
Thanks in advance.
