ABOUT AudioVideoUtilities

This AudioVideoUtilities 1.16 stack is a HyperCard 2.0 fix and enhancement. It corrects some odd printing dimensions for the cassette labeler arising from the 1.2.5 to 2.0 conversion. It also adds the ability to print at Best quality.

AudioVideoUtilities is part of the AudioVideo Library system, which is a shareware package. It is not intended to be used alone and is provided to registered users and those who wish to try out AVL using HyperCard 2.0. If you have obtained the AudioVideoUtilities stack by itself, you can find AudioVideo Library on GEnie, CompuServe, DELPHI, and America Online. Or if you don't have access to any of these services, you can send me a disk and SASE and a request for an evaluation version.

This stack should replace the older AudioVideoUtilities stacks in all HC 1.2.5 to 2.0 converted libraries.

AudioVideo Library is undergoing a 2.0 rewrite and will be changed to take advantage of HyperCard 2.0 features.

IMPORTANT CHANGES AND INFORMATION

The Print button on the Cassette Case Labeler does not operate in the way previous versions of AVL did. It now calls up a Print Stack dialog. This was done to take advantage of the ability to print at Best quality. The Cassette Case Labeler card is the only marked card in the stack so make sure you select the "Print Marked Cards" radio button in the dialog. This is the only and required change that needs to be made for the dialog. Leave the other settings of "Full" card printing size and the "High Quality Printing" check box marked. To print the cassette case label, choose the "Print..." button. A standard printing dialog will appear, and the rest should be familiar to you.

Questions or problems may be directed to any of the physical or electronic

addresses above.
