1.2 what

```
   fd2m is simple converter from fd files (what it 'fd'?) to d compatible
 library modules.
```

```
   Source code is included in PowerD archive ('d:source/fd2m.e'). You can do
 with it everything you like except selling it.
```

1.3 how

```
   It has only one argument:
```

```
 SOURCE/A: source fd file name.
```

```
   It will try to open file called 'name.fd' if you entered 'name'. It will
 write file called 'name.m'.
```
