

ICSCConvert can create icons for your newly color corrected image file. ICSCConvert does check if there is a default user defined icon stored in ENV:sys or ENVARC:sys named ICSCConvert\_def\_project.info. If not, it will use the default system project icon which can also be user defined as def\_project.info icon file<sup>2</sup>.

When defining a default icon for ICSCConvert using ICSCConvert\_def\_project.info it is a good idea to set the icons default tool to point to your display program (for instance CyberShow) for image files. This will allow you to simply double click color corrected images in order to get them display.

If you disable ICS using ICSPrefs, ICSCConvert can be used as a useful tool for converting most image file formats to IFF ILBM as the image data is not color corrected by ICSCConvert during conversion.

And as a last hint if you want to convert multiple image files. It is much faster to call ICSCConvert once for all files instead of calling ICSCConvert for all files individually.

---

<sup>2</sup>Use the Workbench IconEdit programs Save As Default Icon menu item for this.
