

AFM2TFM 1 "9 August 1990"

## NAME

afm2tfm – convert Adobe font metrics to TeX font metrics

## DESCRIPTION

PostScript fonts are (or should be) accompanied by font metric files such as **Times-Roman.afm**, which describes the characteristics of the font called Times-Roman. To use such fonts with TeX, we need TFM files that contain similar information. This program does that conversion. For more information, print out the dvips manual.

## FILES

*psfonts.map* in the config directory used by dvips (update this).

## SEE ALSO

dvips, tex, vptovf

## BUGS

An option to add letterspacing to the virtual font was rejected by Knuth because it would make the fi and fl ligatures break the normal rhythmic pattern.

## AUTHORS

Tomas Rokicki <rokicki@cs.stanford.edu> and Donald E. Knuth
