1.2 Overview

Worm Wars is an arcade game for 0-4 players. It combines the playability of its basic concepts with 25 interesting object types, 7 species of creature, and other enhancements, for more diverse and strategic gameplay.

1-4 worms travel around a rectangular maze leaving a deadly trail behind them, competing and sometimes cooperating with other creatures, collecting letters to advance to the next level.

The integral field editor allows you to load, edit and save user fieldsets, for greater lasting attraction. There is support for playing MED and IFF 8SVX files as music and sound effects respectively. Custom fonts and backgrounds are used.

It is enjoyable either for one player, or for competitive multiplayer

games, and demo mode is available. Amiga or human control can be specified for any worm. Two keyboard players and two joystick players are supported. It is system-friendly, style compliant and it multitasks.

1.3 New Features

- . Support for 2 joysticks, and 4 players.
- . Miscellaneous bugfixes and rule changes.

1.4 Usage

System Requirements
Startup

1.5 System Requirements

Hardware	Required	PAL capability about 256K free RAM about 2Mb disk space
	Recommended	Colour monitor 68030+ Joystick Mouse about 1Mb free RAM Keyboard with numeric keypad Battery-backed clock Graphics board
Firmware	Required	Kickstart R2.04+ exec.library V36+ dos.library V37+ gadtools.library V37+ intuition.library V37+
	Recommended	Kickstart R3.1+
Software	Required	Workbench/CLI R2.04+ asl.library V37+
	Recommended	OS3.5+ MEDPlayer.library (included) icon.library MultiView SetPatch Installer

1.6 Startup

Workbench ToolTypes
CLI arguments

Startup

If the joyport cannot be allocated on startup, the blue worm cannot be selected for human control.

The default behaviour is to load the music and sound effects automatically at startup. The `-f` and `-m` CLI arguments prevent loading of the sound effects and/or music respectively, until needed for use.

If `WormWars.font` cannot be loaded at startup, Topaz 8 is used.

If the specified default fieldset cannot be loaded at startup, `WormWars.fset` is used instead. If it cannot be loaded, a blank, five-level fieldset is used instead, with a treasury floored with silver.

1.7 Workbench ToolTypes

The following can be specified in the game's `.info` file. All are optional.

<code>TOOLPRI=<priority></code>	eg. <code>TOOLPRI=5</code>
<code>FILE=<fieldset></code>	eg. <code>FILE=foo.fset</code>
<code>GREEN=HUMAN AMIGA NONE</code>	eg. <code>GREEN=HUMAN</code>
<code>RED=HUMAN AMIGA NONE</code>	
<code>BLUE=HUMAN AMIGA NONE</code>	
<code>YELLOW=HUMAN AMIGA NONE</code>	
<code>NOFX</code>	eg. <code>NOFX</code>
<code>NOMUSIC</code>	
<code>OVERHEAD</code>	

These are equivalent to the relevant CLI arguments.

1.8 CLI Arguments

Command Information

WormWars

Format: `WormWars [-p=<priority>] [-f|nofx] [-m|nomusic] [green=HUMAN|AMIGA|NONE] [red=HUMAN|AMIGA|NONE] [blue=HUMAN|AMIGA|NONE] [yellow=HUMAN|AMIGA|NONE] [[file=]<fieldset>]]`

Template: `WORMWARS -F=NOFX/S, -M=NOMUSIC/S, -P=PRI/K/N, -O=OVERHEAD/S, GREEN/K, RED/K, BLUE/K, YELLOW/K, FILE`

Purpose: To run the Worm Wars game.

Specification:

`-p:` the priority that Worm Wars will be run at. Higher priorities can help the game to run closer to full speed. Lower priorities can

help the system multitask, by giving less processor time to Worm Wars.

The allowable range is -128 to +5, with the default being 0.

-f: don't bother loading sound effects until asked.

-m: don't bother loading music until asked.

-o: select overhead viewpoint at startup.

colour=HUMAN|AMIGA|NONE:

the initial controls for the worms. For example, GREEN=HUMAN will select human control for the green worm. Unless otherwise specified, RED=HUMAN, YELLOW=AMIGA, GREEN=NONE and BLUE=NONE.

<fieldset>: the pathname of your default fieldset. This is taken exactly as entered; an '.fset' extension is not automatically appended. This is loaded relevant from the current directory. If no argument is given, or your default fieldset cannot be loaded, the default is PROGDIR:WormWars.fset.

?: displays the command line argument format, instead of running the game.

The order of the arguments are interchangeable.

Examples:

```
WormWars /foo.fset      load foo.fset from parent
                        directory, and run at priority level 0
```

```
WormWars -f -p-3 bar.fset
                        load bar.fset from current
                        directory, and run at priority
                        level -3, without loading sound effects
```

```
WormWars HD1:foo.fset -m -f -p4 -o
                        load foo.fset from root
                        directory of HD1:, and run at
                        priority level +4, without loading music or
                        sound effects, and set overhead viewpoint
```

```
WormWars -p+5 /fsets/bar.fset
                        load bar.fset from fsets/
                        sibling directory, and run at priority
                        level +5
```

```
WormWars ?              display command format
```

1.9 Title Screen

Keys

```

Esc F1 F2 F3 F4 .. .. .. .. ..
.... 1 2 3 4 . . . . . <- ... Hel . . . .
..... Q . . . . . I O . . . Ret . . . .
... .. A S . F . . . . . ur . 4 . . .
Shift . . . . . N M . . ? Shift . . . 1 2 3 E
.. .. -----Spacebar----- Am .. -.- . n

```

1-4 or F1-F4 cycles the relevant worm controls through 'None', 'Amiga' and 'Human'. If Shift is held as a qualifier, it cycles backwards.

Return or Enter begins the game.

M toggles the music on or off.

F toggles the sound effects on or off.

I toggles the viewpoint between overhead and isometric 3D.

Menu

Project New	Amiga-N	Creates a blank, 5-level fieldset titled WormWars.fset.
Project Open...	Amiga-O	FSET 4.4-5.1 are supported.
Project Save	Amiga-S	
Project Save As...	Amiga-A	
Project About...	Amiga-?, Help	Credits window.
Project Quit	Amiga-Q, Esc	Exits to CLI/Workbench.

Gadgets

Key	Colour	Human Controls	Letters
1	Green	Left Keyboard	C and L
2	Red	Right Keyboard	O and E
3	Blue	Joystick 2	M and T
4	Yellow	Joystick 1	P and E

Any combinations of human and Amiga control are acceptable, but at least one worm must exist.

1.10 Field Editor

The field editor allows you to load, edit and/or save the playfields which the worms compete on.

You are allowed to have up to 40 levels in each fieldset. The bonus level, that is, level 0, is not considered in the count of levels.

The high score table is loaded and saved as part of the fieldset file: there is a separate high score table for each fieldset. Making any modification to the fieldset will clear all the fieldset's high scores.

If you have modified your field since you saved it and want to do something which will lose the changes you will be asked to confirm your intent.

Hints

Keys

```

Esc F1 F2 F3 F4 F5 F6 F7 F8 . . .
.... 1 2 3 4 5 6 7 8 . . . . . Del Hel ( ) . .
..... Q . E . . . . I O . . . Ret 7 8 9 .
Ctr .. A S D F . . . K . . . . ur U 4 5 6 .
Shift . . C . . . N M . . ? Shift L D R 1 2 3 E
Al .. -----Spacebar----- Am Al -0- . n

```

```
F1      gold
F2      silver
F3      empty
F4      wood
F5      stone
F6      metal
F7      teleport '1'
F8      teleport '2'
F9      start
```

M toggles the music on or off.

F toggles the sound effect on or off.

Delete and Help change the current level (lower and higher, respectively). When shifted, they change to level 1 or the final level, respectively.

C centres the cursor in the centre of the field.

Numeric . stamps the current brush at the current cursor location.

Numeric 0 toggles 'sticky mode'. The sticky indicator will light up or be extinguished, as appropriate. Sticky mode means that the 'brush' is held down: any single-square keyboard cursor movements will alter squares that the cursor passes over to the current brush. Toggling sticky mode 'on' also does a 'stamp' of the current brush at the current cursor location.

F1-F9, when unshifted, change your brush type to the appropriate type, as if the gadget had been clicked. When shifted, the level will be filled (except for start and teleports) with the requested square type, without change to the current brush.

Alphanumeric 1-9 change the square under the cursor to the relevant type, without affecting the current brush.

The cursor keys or numeric keypad move the cursor around the field. The default movement is one square. (If sticky mode is on, copies of the brush are left behind). Holding Alt moves the cursor in increments of five squares. Holding Shift or Ctrl moves the cursor to the relevant edge of the field. (The cursor is shown as a white square.)

Numeric (and) cycle the brush and square under the cursor through the available objects, lower and higher, respectively.

Menu

Project New	Amiga-N	Clears the fieldset.
Project Open...	Amiga-O, O	Loads a fieldset.
Project Save	Amiga-S, S	Saves current fieldset.
Project Save As...	Amiga-A, A	Saves with new filename.
Project Quit	Amiga-Q, Q, Shift-Esc	Exits to CLI/Workbench.
Project About...	Amiga-?	Credits window.
Edit Cut	Amiga-X	
Edit Copy	Amiga-C	
Edit Paste	Amiga-V	
Level Insert	Amiga-I, I	Inserts blank level here.
Level Delete	Amiga-D, Shift-D	Deletes this level.
Level Erase	Amiga-E, Shift-E	Clears this level.
Level Append	Amiga-K, K	Adds blank level to end.

Remember that the menus, and their Amiga-key shortcuts, are unavailable whilst the pointer is over the playfield. The other shortcuts for the menu items will still be available.

Joystick control

A joystick plugged into port '2' can be used in the field editor. Directional controls move the cursor in single square increments. Holding the directional controls continue to move the cursor. The firebutton stamps the current brush at the current location. Holding down the firebutton whilst moving the stick, to produce lines of squares, is not yet supported, though autofire can emulate this behaviour.

You will need to use the keyboard and/or mouse to control other functions of the field editor, such as file operations, changing the brush, etc.

Mouse control

The gadgets to the left of the field will change your current 'brush' to the appropriate type. This brush is assigned to the left mouse button, and the keyboard and joystick. The pointer imagery will be altered to reflect your brush type, for some brush types.

The right mouse button, when over the playfield, will function as 'empty' rather than bringing up the menus.

Clicking on the field will change the current cursor location to the chosen square, and change that square to the current brush (or to 'empty' if the right mouse button is clicked).

Teleports:

Two teleports, '1' and '2', may be defined in the field editor. These teleports will teleport to each other during gameplay. They are completely independent of any teleports that may be created randomly as the game progresses. It is illegal to have only one teleport as it would lead to nowhere. Therefore, whenever the field is saved or you return to the title screen, any lonely teleport is removed.

Start:

The starting location for all worms. This is invisible during gameplay. Usually it is best left where it is, in the centre of the field.

```

      / \
      |
      |
      |
      Blue
<--- Green START Red --->
      Yellow
      |
      |
      \_/

```

1.11 Hints

One starting location is specified for all worms. It must be a considerable distance from all barriers as worms may emerge from it in any orthagonal direction. Also, try not to make any field give an unfair advantage to any particular worms. (The easiest way to ensure this is through the use of symmetry.)

Mazes one square wide are difficult. 3-5 squares width is usually more appropriate for less skilled players.

Point-squares (ie. silver and gold) should be used with restraint, and generally only as a reward for difficult maneouvering. The average field should give have only about 5% point-square density. Richer fields can be made for experienced players, but they should be as a reward for skill.

Goats only fire when they are on the edge of the stone/wood/metal/tail/slime, but they move quasi-randomly. Therefore, some configurations will be more deadly than others. For example, thin lines provide maximum contact between worms and goats, and thick square areas will quickly generate new goats.

Lightly sprinkle your treasury with objects. Use objects very sparingly or not at all in other levels.

Metal squares which are aligned with each other can be deadly and enjoyable, as fragments can bounce between one and the other endlessly until a collision occurs. Remember also that metal is unjumpable.

Registration

You are strongly encouraged to register your copy of Worm Wars. The price for Amiga users is now only \$AUS5, \$US5 or £UK5!

This will enable continuing development of the software, and provide you with free online technical support, additional developer support documentation, regular previews and updates, extra fieldsets and sound effects, fieldset conversion utilities, limited-edition enhanced versions and special offers on other Amigan/Enable Software products. Cheques and money orders should be made payable to James Jacobs. Registration by credit card is possible via our website.

This software is shareware. There are no limits on usage, distribution or modification, except that you are not allowed to modify and/or distribute it for commercial purposes without consent.

Bugs

Official Commodore development and style guidelines have been adhered to, using the official Amiga Technical Reference Series as authoritative reference.

Please contact us immediately if any bugs are found.

Submissions

Fieldsets, music (ST/MED format), samples (IFF 8SVX/WAV), backgrounds (2-colour IFF ILBM 640*256) or even modified versions of the game can be submitted and may be distributed with a future release, with acknowledgements to the contributor(s).

Users are invited to contribute suggestions for the future of the game.

Sound effects

The game uses IFF 8SVX files for its sound effects. Full IFF 8SVX support is not required for the purposes of the game, and therefore the following rules are imposed on the samples:

- Must be an IFF 8SVX FORM (ie. not CAT or LIST).

- No compression schemes are allowed.

- Maximum sample size is 128K.

- Must be 'one shot' style rather than 'musical note' style sample.

- Only the first (highest, longest) octave is used.

- Must be a single channel (ie. monaural) sample.

- 8SVX.VHDR and 8SVX.BODY chunks are, of course, required.

- All other chunks (eg. generic IFF chunk PROP; standard IFF chunks NAME, (C), ANNO, AUTH; proposed IFF chunk END; standard IFF.8SVX chunks ATAK, RLSE; extended IFF.8SVX chunks CHAN, PAN, SEQN, FADE) are ignored.

- Sample rate is taken from the 8SVX.VHDR chunk.

- The repetition flag of the sample (ie. play once or loop), and the volume of the sample, are set in the game header files.

IFF 8SVX or WAV files submitted to Amigan Software as contributions can, if necessary, be converted by us to fit these restrictions.

1.14 Platforms

Worm Wars is also available for Microfilth Windows 95/98/NT.

It is directly in your interests to register this software. Amigan Software has and always will continue to provide quality Amiga software. The Amiga community which has fallen on hard times needs to support its users and developers.

Amiga registration is now only \$AUS5/\$US5/£UK5!

Thanks to all those whose software was used to create Worm Wars.

1.16 Source Code

The Amiga version is written in C (SAS/C 6.3), whilst the IBM-PC version is written in hybrid C/C++ (Microfilth Visual C++ 5.0), using Microfilth Foundation Classes.

Both platforms use the identical game engine, written in C, with API calls for the relevant OS in other modules.

SAS/C 6.3 source code is provided, with which you may do as you wish for non-commercial purposes. Developer documentation, graphics files, and source code for either or both platforms is available free to registered users.

The Amiga source files are as follows:

system.c	Amiga-specific code, including all AmigaOS calls.
engine.c	Code common to the Amiga and IBM-PC versions.
diff.h	Header file used by both modules. Amiga-specific.
same.h	Header file common to both modules and both platforms.
ww.s	AmigaDOS script to link modules into executable.
SCOPTIONS	SAS/C options we prefer to compile with.
libproto.h	MEDPlayer.library C header.
stdafx.h	Required for IBM-PC compatibility.

The executable is now optimized, although it uses MC68000 instructions. Recompiling for your exact CPU type will improve the game's speed and size.

The future of this software is dependant on the support it receives from its users. Your contribution will support further Amiga software development and enhancement.

1.19 Other Products

Worm Wars 5.21 for Windows 95/98/NT

The Amiga version of Worm Wars has long been popular the Amiga community, acknowledged as the premier snake game for many years. It is also available to the masses of benighted Windows users. This version includes dockable toolbars, a status bar and automatic saving/reloading of configuration information.

Worm Wars 5.1a for Windows 95/98/NT is freely distributable. Worm Wars 5.21 for Windows 95/98/NT is only available to registered users.

Report+ 1.1

Report+ is an enhanced, 100% byte-compatible version of the official Commodore bug reporting tool (40.2). Rather than the console.device, it uses a rich GadTools interface to present user-friendly form-like windows. It can also generate Aminet readmes.

All Commodore-defined subsystems are supported, and the program can also generate reports for Amigan Software's product line.

1.20 How to Play

Worm Wars is an arcade game for 0-4 human players. Each player controls a worm. They move around a semi-toroidal rectangular (53x39) playfield, leaving their tails behind them. Each worm aims to amass the most points, to complete the levels and to survive as long as possible.

Controls	Worms	
Letters	Orbs	
Objects	Goats

Worm control principles

Worm control is an acquired skill and is the single most important factor in playing successfully and enjoyably.

A worm has direction and speed. It is unable to ever stop completely, unless frozen by ice, but its speed is adjustable between

three settings. Normally, it can turn 90\textdegree{} in any direction and moves orthagonally (north, south, east, west), but a nitro will enable 45\textdegree{} and 135\textdegree{} turns and diagonal movement.

The worm can pass through most types of square, though some cause damage. Some squares slow the worm down, halving its speed for every square traversed (to a minimum of 'slow'). Stone, metal, goats and blocked teleports will block the worm's motion as well as slow it.

Control of the worms is by keypresses; that is, press and release in a normal keystroke motion. There is no reason to ever hold down any key. Only fresh keystrokes are ever looked at by the program. Also, holding down a key may lock out your input (see below).

For joystick control, it is best to nudge the joystick briefly in the direction you want, and let it return to the central upright position.

Each move, a worm is able to do any one of five things:

- . fire (in the current direction);
- . change direction;
- . change speed (one speed in either direction);
- . jump; or
- . nothing.

The worm will move one square regardless. This means you can:

fire in your current direction and move in your current direction,	
change direction	and move in the new direction,
change speed	and move in your current direction.
jump	leaping 2-4 squares and then landing, in
	your current direction.
nothing	and move in your current direction.

Speed changes are accomplished using the same keys as for turning. Pressing the direction you are already travelling increases your speed; pressing against that direction decreases your speed.

Keyboard [green and red]

If only one human is selected for the keyboard, all three sets of keyboard controls are available for that player, whether it is the green or red worm. When only one human is selected for the keyboard, we suggest using the cursor keypad, as it has the best rollover properties (ie. you can press a key whilst another is already held down). However, the cursor keypad obviously does not support diagonal movement.

Two players may use the keyboard, playing at each end. If there are two humans selected for the keyboard, the cursor keypad cannot be used, due to keyboard hardware limitations. The green worm must use the leftmost controls (QWEASDZXC, spacebar) and the red worm must use the rightmost controls (the numeric keypad).

Note that the leftmost and rightmost controls do not rollover properly, due to keyboard hardware limitations. This means that you must release all keys before pressing another one, or the new keystroke is ignored

and so is all further input from that player until all keys are released. The other player's keystrokes are completely unaffected by what you do; you can only cause this problem for yourself.

X and C are both down-right for the green worm.
Spacebar is the firebutton for the green worm.

5 and 2 are both down for the red worm.
0 and Enter on the numeric keypad are both
firebuttons for the red worm.

Joystick [blue and yellow]

The blue worm can use a joystick plugged into port '2'. If the joystick could not be allocated during initialization then human control will be unavailable.

The yellow worm can use a joystick plugged into port '1'. This uses direct hardware access, rather than using the gameport.device. Therefore allocation can never fail.

1.22 Letters

There will always be one, neither more nor less, letter onscreen at any given time. When a worm collects it, another, which that worm needs, will appear.

The main objective of the game is to complete all the levels. The level will be completed and the next loaded as soon as a worm has all eight letters, which together spell the word COMPLETE. All worms will then lose all their letters. The worm which completed the level receives these points:

- 100 x old level
- 10 x seconds remaining
- 1 x tail squares of your colour onscreen

Only worms and their protectors go on to the next level; other creatures perish. Each level is faster than the last, and creatures are faster and more frequent.

Only 2:00 (two minutes) are allocated for each level. After that time has elapsed, the speed of all missiles, drips, orbs, fragments, goats and penguins currently existing at the time will double, and the frequencies of all subsequently created drips, orbs, goats and penguins will double.

1.23 Objects

Type	Points	Frequency
Affixer	60	Very rare

Ammo	20	Common
Armour	20	Common
Bias	50	Common
Bomb	30	Common
Bonus	10	Common
Clock	60	Very rare
Grower	50	Uncommon
Healer	90	Very rare
Ice	60	Very rare
Life	50	Uncommon
Lightning	40	Uncommon
Missile	40	Uncommon
Multiplier	50	Rare
Nitro	10	Uncommon
Powerup	30	Uncommon
Protector	50	Rare
Pulse	40	Uncommon
Remnants	40	Uncommon
Slayer	40	Rare
Slower	40	Rare
Switcher	70	Rare
Tongue	20	Uncommon
Treasure	100	Very rare
Umbrella	100	Very rare

1.24 Affixer

This causes your protectors to stop rotating and zigzagging. They are 'fixed' into position at whatever position they were in at the time. This makes them more useful, as you can more easily predict where they will be at any given time in advance.

1.25 Ammo

This will provide 2-6 bullets.

Bullets are fired by pressing your appropriate fire control. If a bullet is available, you will fire. This bullet is instantaneous. If you have no bullets, you may jump.

The width of your bullet depends on powerups. Normally, it is 1 square wide, but it can be up to 7 squares wide. In reality, up to 7 independent bullets are fired.

A bullet which hits a teleport will be teleported and continue on its way. You will get the teleport skill bonus, too. That segment of the bullet will thereafter leave a trail of gold behind it.

A bullet which goes through the same teleport twice, or is reflected off metal twice, will be destroyed.

In the absence of obstructions, a bullet continues going until it reaches

the edge of the field.

is bounded by	field edges
destroys	tails
destroys	empty/silver/gold
destroys	objects
is absorbed by	skulls
if biased, destroys, else is absorbed by	wood
is absorbed by	stone
is reflected by	metal
is teleported by	unblocked teleport
is absorbed by	blocked teleport
harms and is absorbed by	unarmoured worm heads
is absorbed by	armoured worm heads
explodes and is absorbed by	unarmoured orbs
is absorbed by	armoured orbs
passes through	friendly protectors
is absorbed by	enemy protectors
passes through	friendly missiles
destroys	enemy missiles
bonusizes and is absorbed by	goats
destroys and is absorbed by	fragments
is absorbed by and sets off	timebombs
destroys	drips

When a bullet sets off a timebomb the effect is as if the timebomb had elapsed its countdown and detonated normally (ie. you do not receive points for the blast, and can be harmed by it). So beware.

1.26 Armour

Armour will protect worms from being hurt by many different causes. For a list of them, [click](#).

Armour is only temporary. Its power counts down at a constant rate, and can be extended by the acquisition of more armour. It is a mode.

While you are in armour mode your head-image will be different. When your armour is nearly gone your head will flash.

1.27 Bias

Provides these benefits:

- missiles will not chase you.
- you can shoot through wood.
- whenever you shoot you will also launch a missile, if possible.
- vampirism: whenever you cause a worm to take damage, you gain as many lives as they lost. Whenever you kill an orb, goat, or penguin, you gain a life.

any bombblast by you will turn squares to silver, not empty.
 when you get treasure, you will always go to the treasury.
 when you get a switcher, enemy remnants are also switched to your
 own colour.

Bias counts down at a constant rate. It can be extended by the acquisition of more bias. You can use bias in conjunction with one of the modes.

1.28 Bomb

As soon as you go over one of these the bomb will go off, clearing the area around you. The blast radius is random, but is always constrained by the field edges.

is bounded by	field edges
does not affect	empty/silver/gold
destroys	objects
does not affect	skulls
does not affect	wood
does not affect	stone
does not affect	metal
does not affect	teleports
harms	unarmoured worm heads
does not affect	armoured worm heads
bonusizes	unarmoured orbs
does not affect	armoured orbs
does not affect	friendly protectors
does not affect	enemy protectors
does not affect	friendly missiles
destroys	enemy missiles
bonusizes	goats
destroys	fragments
destroys	timebombs
destroys	drips

A bomb may at any time randomly change to a timebomb, which ticks from 9 down to 0 before detonating. During ticking, it can be pushed around by worm heads. If pushed into a teleport or off the field edges, 100 points are given and the timebomb is destroyed without detonation. If pushed against things, or shot, or hit by a fragment, or an orb, it will detonate immediately. If this was from pushing against things, or the timebomb was shot by a worm bullet, the worm responsible gets the points from the blast. If an orb set the timebomb off, it gets the points. In any other case, no points are given from the blast. There can be up to four timebombs onscreen simultaneously.

If a timebomb is pushed over a skull, the skull is destroyed and points are given to the pusher, but none of dead worm's attributes are acquired.

1.29 Bonus

You will be given a random letter. It may be one you already have. You do not receive skill points for letter collection, only your points for collecting this object.

1.30 Clock

If there is still any time remaining, the amount of time remaining is increased.

1.31 Grower

This will cause all gold and silver onscreen to 'grow', expanding into their neighbouring squares if those neighbouring squares are empty. If you have bias, all tail of your colour will also grow.

1.32 Healer

If you have less than your starting lives (100), boosts you back to 100. If you have 100 or more, boosts you to 200.

1.33 Ice

Ice will freeze all orbs, goats, drips, fragments, missiles, penguins, timebombs and enemy worms for a short period of time. There is no defence against ice. Additional ice will be added onto your amount remaining.

1.34 Life

This provides 2-6 lives.

1.35 Missile

Missiles are automatically guided. They hunt the following things:

- worms
- enemy missiles
- orbs
- goats

The missile hunts whatever is nearest, and recalculates its target every move.

Missiles will not cross field edges.

Although they will hunt armoured worms and armoured orbs, they cannot harm them and will be themselves destroyed on impact.

destroys	tail
destroys	silver and gold
is absorbed by	skulls
destroys	objects
destroys	wood
is absorbed by	stone
is absorbed by	metal
is teleported by	unblocked teleports
is absorbed by	blocked teleports
harms and is absorbed by	unarmoured worm heads
is absorbed by	armoured worm heads
destroys and is absorbed by	unarmoured orbs
is absorbed by	armoured orbs
passes through	friendly protectors
is absorbed by	enemy protectors
bonusizes and is absorbed by	missiles
bonusizes and is absorbed by	goats
destroys and is absorbed by	fragments
is absorbed by and sets off	timebombs
is absorbed by	drips

If you collect a missile whilst:

you already have two active missiles; or
there is nothing for it to chase

then you will receive only points; no missile will be generated.

1.36 Lightning

When you get lightning, most squares adjacent to your tail flash momentarily. This will harm:

unarmoured enemy worm heads	
unarmoured orbs	replaced by bonus
goats	replaced by bonus
slime	replaced by empty
fragments	replaced by empty
drips	replaced by empty
objects	replaced by empty
penguin	replaced by empty
enemy missiles	reaplced by empty

The only things that are not flashed are:

stone
metal
wood
letters

skulls

1.37 Multiplier

Each time you get a multiplier, your scoring will be doubled. If you get more than one, it is doubled again each time. You can collect up to three (3) multipliers.

Your object points for actually getting the multiplier are affected by the new multiplier itself.

Multipliers	Scoring
0	*1
1	*2
2	*4
3	*8

At the end of each level, your multiplier will be reduced by one (ie. half).

1.38 Nitro

You will be able to move diagonally. Nitro cannot be lost.

1.39 Powerup

This is power for your bullets. Each bullet you fire becomes wider, requiring less aiming accuracy and causing more general devastation.

Symbol	Meaning			
<number>	bullet number			
:	worm head, facing up (north)			
:	worm head, facing up-right (northeast)			
#	worm tail			
1	213	42135	6421357	
1	213	42135	6421357	
1	213	42135	6421357	
1	213	42135	6421357	
:	:	:	:	
#	#	#	#	
#	#	#	#	
Single (no powerups)	Triple (one powerup)	Quintuple (two powerups)	Septuple (three or more)	
1	312	53124	7531246	
1	312	53124	7531246	

1	312	53124	7531246
1	312	3124	31246
:	:2	:24	:246
#	#	#	# 6
#	#	#	#

1.40 Protector

Acquisition of this item will give you a companion who stays near you, collecting objects for you exactly as if you had moved over them yourself, and defending you from some forms of damage.

You can have up to three protectors. The first two orbit around your head. The third will be a 'nose', suspended three squares in front of your head, which zigzags. The rate of orbiting/zigzagging is the same as the worm's speed; that is, they move when the head moves.

An affixer will stop the protectors from rotating and zigzagging.

is bounded by	field edges
is invisible over	friendly tail
is invisible over	enemy tail if protector-worm
	is tongued
destroys	enemy tail if protector-worm
	is untongued
destroys and earns points for	empty, silver and gold
destroys, earns points for	skulls
and earns attributes for	
is invisible over	wood, stone and metal
is invisible over	teleports
harms	unarmoured worm heads
is invisible over	armoured worm heads
destroys	orbs
destroys and is absorbed by	enemy protectors
passes freely through	friendly missiles
destroys	enemy missiles
bonusizes	goats
reflects	fragments
is invisible over	timebombs
destroys	drips

1.41 Pulse

7 fragments are fired outwards when this object is collected, similar to an orb exploding. If another worm's pulse fragments are still onscreen, less than 7 fragments will be generated.

1.42 Remnants

Each time you collect a remnant object, you are given 2-6 remnants. These enable your bullets to leave their remnants behind them as they travel.

These images of the bullet do no harm to the worm that fired it, nor to any other creature except enemy unarmoured worms.

1.43 Slayer

Slayers are used instantly. They will destroy all goats, slime, drips, orbs (by explosion), penguins and enemy missiles, and cause damage to all unarmoured enemy worms.

1.44 Slower

This will slow all fragments, orbs, goats, drips and penguins to half their previous speed. The speed of these is reset at the start of each level.

1.45 Switcher

All tail onscreen is instantly changed to your own colour. The main benefit of this is that you take much less damage over your tail than over an enemy tail, and also that you will receive more points at the end of the level.

1.46 Tongue

Tongue allows you to go through wood and worms (heads or tails) without taking damage.

Whenever a worm with tongue goes over a tail square it receives:

5 points	if it eats friendly tail. Tail turns to silver.
10 points	if it eats enemy tail. Tail turns to gold.

Your protectors will not eat any tails while you are in tongue mode, to help you maximise your score.

Tongue is only temporary. Its power counts down at a constant rate, but can be extended by the acquisition of more tongue. It is a mode.

While you are in tongue mode your head-image will be different. When your tongue is nearly gone your head will flash.

1.47 Treasure

The worms will enter the treasury for a limited amount of time. At the conclusion, the next level is reached. The full time bonus (2:00, which is 1200 points) is given at the end of the treasury.

1.48 Umbrella

This skips 2-3 levels.

1.49 Strategy

Goats prefer to be near free space (empty, gold or silver), so that they can shoot.

Faster speeds are useful for:

- racing another creature for a letter or object;
- hunting another creature when you have tongue or armour;
- evading missiles and fragments;
- laying tails to trap other creatures;
- creating gold/silver with tongue;
- amassing more square-points by moving;
- amassing more square-points at level completion;
- making large jumps;
- causing protectors to rotate faster.

Slower speeds are useful for:

- making small jumps;
- waiting in a certain region of the screen;
- not filling the playfield;
- easier control.

You will get more points by shooting something than killing it by other methods, and more from collecting real letters than getting bonuses.

Remember that bullets, bombs, missiles, fragments and drips will not wrap around playfield edges. If you do, they cannot follow.

Certain objects work well together. Eg.:

- bullets, powerups and bias;
- multipliers and armour;
- tongue and grower;
- treasure and ice;
- protectors and affixer.

To avoid a missile, get a worm, orb, enemy missile or goat, or a solid barrier such as stone or metal, between you and it.

Going quickly between teleports yields many points. It is easier when

done using tongue.

The only way to destroy stone or metal is to kill a goat which is on it.

When you shoot an orb, it will explode, so it is better to be some distance away when doing so.

Shooting an orb (which will explode) or timebomb (which will detonate) can be a useful way of harming, or putting pressure on, an enemy creature which is at the opposite end of the field. However, note that you can be harmed by this. If you have at least triple shot, you can safely shoot an orb if you are not directly lined up with it (and you do not move into the path of the fragments). For shooting timebombs, it is best to be as far away from it as possible.

The best way to handle slime is to encapsulate it with your tail, so it cannot spread.

1.50 High Scores

High scores are part of the .fset file. To save them, save the fieldset. Any changes to the fieldset will automatically clear the high scores.

The Amiga worms have names which honour the four original Amiga designers. Even on the IBM-PC version. :-D

1.51 Worms

Worms can be controlled by humans or the Amiga. For information on how to control them, click.

A worm consists of a head, one square in size, and a tail, which is formed in the wake of the head's passing. As the worm moves, the tail stretches out behind its head. Collision with any part of a worm by the head normally results in damage (to the head).

Worms can move in the four cardinal orthagonal directions and at three speeds; getting a nitro allows diagonal movement.

Worms begin with 100 lives. Whenever you are taking damage your head will change to a skull temporarily. This is a visual change only. When 0 lives is reached, the worm is dead and the skull is permanent. Every 1,000 points you will be awarded an extra life.

Modes

Armour and tongue are mutually exclusive 'modes'. You can only have one in use (and therefore counting down in strength) at a time, and it will be whatever was most recently collected. The head's appearance indicates whether it is in a 'mode', and also the direction it is currently travelling. It will flash when the current mode is at low

strength. When the strength reaches zero, the other mode is automatically engaged, if above zero.

Skulls

If a worm or protector collects the skull of a dead worm, the collecting worm will get everything the worm had at the time of death (multiplier, bias, power, ammo, armour, tongue, nitro and affixer), in addition to what you yourself already had.

Skulls absorb any bullets, missiles, drips or fragments, and are immune to bombblasts.

Jumping

A worm with no ammo can jump instead. If the destination is stone, metal, a goat or a blocked teleport you will not jump, and metal cannot even be jumped over. The distance varies according to your speed, and is shown below.

Name	Speed	Jump distance
. Slow	half speed	2
. Normal	normal	3
. Fast	double speed	4

All worms can be hurt by the following methods:

Method	Damage	Notes
enemy drip	5 lives	unless biased
blocked teleport	5	worm motion is stopped
goat	2	worm motion is stopped
metal	2	worm motion is stopped
stone	1	worm motion is stopped

'Worm motion is stopped': Every move in which the worm takes damage from that cause, its speed is halved (to a minimum of 'slow'). The worm is unable to actually enter the square.

Unarmoured worms can also die by the following methods:

remnant	5	worm is slowed
worm bullet	5	
enemy missile	5	
enemy protector	5	
orb	5	
fragment	3	if armoured, fragment is reflected
bombblast	3	
lightning	3	
enemy slayer	2	
slime	2	
wood	1	worm is slowed

Untongued worms can also die by the following methods:

worm head	5	
worm tail	1	worm is slowed

1.52 Orbs

Orbs are controlled by the Amiga. They move diagonally and bounce whenever they hit a tail, metal, stone, wood or goat, so their motion is be predictable. Orbs have their own scores, which are added to the scores of those that kill them.

Objects

Objects can be used by orbs, as follows:

Affixer	This will remove any affixer from any worms.
Ammo	The orb will explode, unless it is armoured.
Armour	Same as worm.
Bias	This will remove all bias from all worms.
Bomb	Same as worm.
Bonus	Points only.
Clock	The time remaining is reduced.
Grower	All wood onscreen will 'grow', expanding into their squares if those neighbouring squares are empty.
Healer	The orb will split.
Ice	The orb will split.
Life	The orb will split.
Lightning	The orb will explode, if unarmoured.
Missiles	All missiles will be destroyed.
Multiplier	Same as worm.
Nitro	Doubles the orb's speed.
Powerup	Doubles the orb's speed.
Protector	This will slay all protectors.
Pulse	The orb will explode, if unarmoured.
Remnants	Doubles the orb's speed.
Slayer	The orb will explode, if unarmoured.
Slower	Double's the orb's speed.
Switcher	All tail onscreen is instantly changed to wood.
Tongue	This will allow the orb to pass through wood and tails instead of bouncing off them.
Treasure	The orb will split.
Umbrella	The orb will split.

Splitting

The orb will split into up to four orbs, depending on the number of orbs already in play.

Each orb willil be an exact clone of the original in all attributes, except starting direction but including score. Once born, they are completely independent, of course.

Modes

Armour and tongue are mutually exclusive 'modes'.

An orb can only have one in use (and therefore counting down in strength)

at a time, and it will be whatever was most recently collected. When the strength of it reaches zero, the other mode is automatically engaged, if above zero. The orb's colour indicates the 'mode' the orb is in:

Colour	Mode
Yellow	None
Blue	Tongue
Red	Armour

Collisions

An orb with tongue passes through and destroys slime.

An orb with armour bounces off slime. An orb with neither dies.

All orbs can be slain in these ways:

Notes	Cause
*	Any worm gets a slayer. All orbs explode.
#	Becoming trapped (unable to move).
#	Collision with another orb.
#	Collision with worm tail.
.	Collision with an armoured worm.
.	Collision with a protector.

Unarmoured orbs can also be slain in these ways:

*	Worm bullets.
*	Fragments.
*	The orb collects ammo or slayer.
*	Drips.
#	Bombblasts.
#	Missiles.
#	Lightning.
.	Collision with an unarmoured worm.
.	Collision with slime when unarmoured and untongued.

Symbol	Explanation
*:	The orb explodes.
#:	A bonus is left at the site of death.

1.53 Goats

Goats walk along the top of stone, metal, wood, tails and slime, firing fragments randomly when they are at an edge (next to somewhere they can't go). Goats prefer to be at an edge and tend to move towards and stay at one. When not at an edge, they cannot fire.

Goats can be slain in these ways:

Worm bullet
Fragment

Slayer
 Orb bouncing off it
 Bombblast
 Missile
 Drip
 Lightning

Dead goats always turn into bonuses. This is the only way to destroy stone or metal.

1.54 Slime

Slime may be randomly created at during play. This slime can 'grow' into some adjacent squares over time. It never moves, only grows.

Normal orbs	are destroyed by it
Armoured orbs	bounce off it
Tongued orbs	pass through and destroy it
Normal worms	are harmed by it
Armoured worms	pass through and destroy it
Tongued worms	are harmed by it
Goats	can traverse it
Protectors	destroy it
Fragments	destroy it
Worm bullets	destroy it
Slayers	destroy it
Bombblasts	do not affect it
Drips	destroy it
Lightning	destroy it

1.55 Drips

Drips appear near the top of the field, and fall downwards. They can be any of the four colours (green, red, blue and yellow).

Drips of your own colour (or another colour, if you have bias) are worth 100 points. Drips of the wrong colour hurt you. In either case, the drip is destroyed.

1.56 Fragments

Fragments are generated by:

orb explosions.
 pulse explosions.
 goats firing.

Fragments travel until they are absorbed or reach the field edges.

is bounded by field edges

destroys	tails
destroys	silver and gold
destroys	objects
is absorbed by	wood
is absorbed by	stone
is reflected by	metal
is absorbed by	blocked teleports
is teleported by	unblocked teleports
harms and is absorbed by	unarmoured worm heads
is reflected by	armoured worm heads
explodes and is absorbed by	unarmoured orbs
is absorbed by	armoured orbs
is reflected by	protectors
destroys and is absorbed by	missiles
bonusizes	goats
destroys and is absorbed by	fragments
sets off and is absorbed by	timebombs
bonusizes	drips

1.57 Penguin

Penguins are randomly created, independent creatures which move randomly. They are not aggressive but will harm things that collide with them. They only ever move onto empty squares.

1.58 Teleport

These always come in pairs. Going through one will teleport you to the other, and bestow points also.

The following are teleported:

- worms
- orbs
- worm bullets
- fragments
- missiles
- drips

If a teleport is blocked (there is stone, metal or a goat next to its partner on the side where you would emerge) then the teleport cannot be used and is dangerous. You will slow down from hitting it and not be able to use it. It is obviously possible for a teleport to be blocked to some approaches and unblocked to others.

Protectors are invisible over teleports.

Two teleports may be defined in the field editor; another two may appear randomly during play. These two sets are completely independent of one another.

1.59 Scoring

Square points

All

1	Empty
10	Silver
20	Gold
100	Skull

Objects are worth various amounts of points.

Worms and orbs

40	Teleport
----	----------

Worms and protectors

100	Drip of your colour
100	Letter of other colour
200	Letter of your colour

Skill points

All

50	Kill a penguin.
50	Kill a goat.
100	Hurt an enemy worm, without hurting yourself.

Orbs are worth their scores to anything that kills them.

Worms

5	For each square you turn to silver with tongue.
10	For each square you turn to gold with tongue.
50	You hurt something (worm, orb, goat or penguin) by shooting.
100	Push a timebomb off field edges or into a teleport.

There are also level completion bonuses.

All points are multiplied by the number of worms selected for human and Amiga control, and of course by any multipliers.
