

**TransEdit 3.04 — Release Notes**

---

This document is an adjunct to the TransEdit Programmer's Manual. It lists changes and additions specific to release 3.04. If you have only programmed with pre-3.0 releases of TransEdit, be sure to read any earlier 3.XX release notes as well.

- Revised the TransEdit manual slightly. This is the first revision that reflects any changes that have been made since release 3.0 began.
- New function `GetNewEWindow()`, which is the resource equivalent of `NewEWindow()`.
- The window creation calls now actually test for allocation errors.
- Did away with a number of global variables in the library code. This makes the compiled code a little larger, but the logic is somewhat cleaner since there are fewer hidden assumptions made about what's set and what isn't.
- Fixed bug in handling of getfile dialog — forgot a call to `SkelRmveDlogFilter()`.
- `TransEdit FakeAlert()` call now takes an argument indicating which button is the Cancel item. This allows it to do key-mapping for Escape and Command-period. The alert also includes a caution icon now.
- Updated the demonstration applications TinyEdit and DumbEdit somewhat.
- Fixed bug in `EWindowEditOp()`. It was marking edit windows dirty after any operation from the Edit menu. Now it only does so for Cut, Paste, and Clear. It doesn't do so for Undo (which is unimplemented) or for Copy (which doesn't change the window contents).
