

ProView is the exciting new program which allows anyone to quickly and easily create a digital portfolio as a stand-alone application.

To begin, simply open a new page and import pictures and movies. ProView allows multiple pictures and movies on a single page. Both pictures and videos are always movable and scaleable. A floating, custom video controller is built into ProView. As additional pages are created, each page is automatically added to the "Contents" menu.

Textboxes with full text edit features can be added by selecting "Add Textbox" from the convenient "Page" menu. Hot spots are easily defined - allowing any portion of the page to become a button which instantly opens any other page. A hot spot may also be assigned to play a sound.

All choices in ProView are always editable. Simply double-clicking on an item or a page brings up its "Info" dialog box. Pictures, video and sounds are linked, so that any changes made to the original files are updated the next time the page is opened. Pages are then saved together in a project file for future revisions.

When projects are completed, choose "Create ProViewer" from the "File" menu. All pages, pictures, video, text and sounds are compressed and compiled into a single, stand-alone ProViewer application. ProViewer allows pages to be viewed full screen, in multiple windows or played as a self-running "slide show". They may be copied to disk or delivered over the Internet to be played on any Macintosh - royalty free.

All of this makes ProView the perfect application for anyone who has digital media and wants to create a portfolio, brochure, catalog or album. In fact, there are infinite uses for ProView for everyone because with ProView, no programming skills are required!
