

Windows Menu

This menu can be used to switch between windows quickly. Opening a new window adds its name to the bottom of the Windows menu, closing a window removes its name from the list. The currently active window is indicated by a checkmark to the left of its name. The Windows menu is particularly useful if many windows are open and some are covered completely by others.

- Rotate (or $\hat{E}\sim$ -R)

This command moves the front window to the back and activates the next window. Repeated use of the Rotate command cycles through all windows currently open.
