 - Programmable import/export
 - Links to other scriptable programs
 - Batch processing
- Drag & Drop editing
- Custom import dialog
- Apple Guide and Balloon Help
- 68K and PowerPC-native code

Quest Equation Syntax (QES)

Almost any technical analysis indicator can be expressed in Quest's equation syntax.

Built-in functions include moving averages, momentum, oscillators, conditionals, extremes, and time-shifts. Even more complex formulas can be constructed for binary waves, rank comparisons, stochastics, MACD, de-trend, and virtually any other indicator. In addition relative comparisons can be made to external files, even when the external file's period (daily, monthly, ...) is different.

Price: \$149.00
