This tutorial will walk you through setup of the main features of TeleMagic. At the bottom of each window, you will find buttons for accessing the full TeleMagic help project: , exiting this tutorial:

, returning to the table of contents:

, and moving to the next:

or previous page:

of the selected lesson. It is recommended that you have TeleMagic running and perform the setup as each step is discussed. When you have completed the steps in the current page, click Next to move to the next page.

As you move through this tutorial, the instructions will appear near the option being discussed. TeleMagic should be maximized. (You should see this    set of buttons on the right of your title bar. If you see this

set of buttons, click this

button to maximize TeleMagic.) You should also make sure your Windows taskbar does not appear over TeleMagic. If it does, close TeleMagic and access Taskbar Properties by right clicking on the taskbar. Either mark Auto Hide, or unmark Always on Top. Save these properties then launch TeleMagic again.

For proper alignment of the instructions and the TeleMagic options, select your monitor resolution from the list:

640x480 Screen Resolution

800x600 Screen Resolution

1024x768 Screen Resolution (Small Fonts)

Key Fields let you tell TeleMagic what fields in your database contain key information. For example, you may want to print address labels for your contacts. TeleMagic needs to know which fields contain the name and address information.

Key Field setup is done in TeleMagic's Preferences. Preferences allow you to control how TeleMagic behaves. Access Preferences by selecting **Options**, **Preferences** from the menu at the top of TeleMagic. If Preferences is already open, proceed to the next step. Your changes will be saved when you finally click **OK**. If you click **Cancel**, all changes will be abandoned.

The Key Fields screen lets you select the contact fields in your database that contain information that TeleMagic will need to use when referencing a record. Each field reference is followed by a drop down list: Click in the field to the right of each field name to view a list of the available contact fields. Highlight a field on the list to select it as the Key Field.

Word Processing Setup

The TeleMagic Word Processing feature allows you to link between TeleMagic and your word processor. TeleMagic's merge function allows you to create documents and document templates in any of the supported word processors. These can be anything from a letter to a contact, to a company newsletter. You can set up any combination of supported word processors. Before you can use the word processing features, you must set up at least one word processor.

Accessing Writing Preferences

Word Processing setup is done in TeleMagic's Preferences. Preferences allow you to control how TeleMagic behaves. Access Preferences by selecting **Options, Preferences** from the menu at the top of TeleMagic. If you already have the Preferences page open, continue to the next step. Any changes you have made will be saved when you finally click OK. If you click Cancel, all changes will be discarded.

The TeleMagic Dialer allows you to use a modem attached to your computer to automatically place phone calls to your contacts. It also allows you to keep a history of calls you have made to each contact. In fact, you can track call information even if you do not have a modem. If you do have a modem, it should be installed and tested before setting it up in TeleMagic. Once your modem works, you can set up TeleMagic to communicate with it.

Faxing Setup

The TeleMagic fax system allows you to fax documents, reports, and other files to your contacts. You have the choice of faxing from your local workstation, or setting up a special workstation that will act as a server. This lesson covers local fax setup. (Server setup is an advanced feature that is covered in the *System Administrator Guide* and in the main TeleMagic help.)

Wireless Messaging allows you to send pages through TeleMagic to your contacts or other TeleMagic users. Setup of the Wireless Messaging feature involves setting up your workstation for sending pages, and entering information that TeleMagic will use when other users want to send a page to you.

The System Administrator can also add fields to the contact database screen for sending Wireless Messages to contacts. [Click here](#) if you are the System Administrator and would like to set up this feature.

Wireless Messaging setup is done in TeleMagic's Preferences. Preferences allow you to control how TeleMagic behaves. Access Preferences by selecting **Options, Preferences** from the menu at the top of TeleMagic. If you already have Preferences open, proceed to the next step. Your choices will be saved when you finally click **OK**. If you click **Cancel**, all changes will be abandoned.

Branch Scripting Setup

A script is a pre-written set of statements, answers, questions, or instructions. At each “branch” or page of the script, you are given a list of choices. You move through the script by selecting the next piece of information to view from the list. For example, a script might instruct you to ask a customer a question. The branch you open next will depend on the customer’s answer. Scripts are used mostly by people who work with customers over the telephone, but they can be used anywhere you want to move through a set of steps. **Branch Scripting setup is limited to Supervisor users. If you are not a TeleMagic Supervisor, click Contents to select another lesson.**

Loops Follow

This dialog box lets you create an expression to define the record descriptor using TeleMagic contact fields, functions, variables, and/or text. (The Expression Builder is an advanced TeleMagic feature. It is recommended that you review TeleMagic's on-line help for information on building expressions.)

Functions are special tools that give you more power in your expression. For example, if you have a field that contains a name, but you want to only use the last name, there is a function that will pull just that information. A **Variable** is data that changes. For example, the database level that is currently open is a variable. TeleMagic's on-line help gives complete information and examples on the available functions and variables.

If you would like to store Wireless Messaging data in your contact records, you may add fields to your contact database to store this information. When you access the Wireless Messaging feature from a record, TeleMagic will read this information and offer it as a default. To add fields to your database, select **File, Add/Edit Fields** from the menu at the top of TeleMagic.

Once the fields have been added, you must set up your Key Fields to point to your new fields. Key Field setup is done in TeleMagic's Preferences. Preferences allow you to control how TeleMagic behaves. Access Preferences by selecting **Options, Preferences** from the menu at the top of TeleMagic.

Expression Builder for Scripting

This dialog box lets you create an expression using TeleMagic contact fields, functions, variables, and/or text. (The Expression Builder is an advanced TeleMagic feature. It is recommended that you review TeleMagic's on-line help for information on building expressions.)

```
{ewc rhgbtn32.dll, BlueSkyHelpButton, g<MENUSM.BMP|

Variables and Functions

Functions are special tools that give you more power in your expression. For example, if you have a field that contains a name, but you want to only use the last name, there is a function that will pull just that information. A **Variable** is data that changes. For example, the user that is currently logged into TeleMagic is a variable. TeleMagic's on-line help gives complete information and examples on the available functions and variables.

```

Text of the Expression

When you select functions, variables, or fields, they will appear in this box. If you have more than one item selected, each should be separated by a plus sign.

```
{ewc rhgbtn32.dll, BlueSkyHelpButton, g<MENUSM.BMP|

```

Saving your expression

When you have finished with your expression, click **OK**. TeleMagic will check the expression to make sure there are no errors. If there are, you will get a message and be allowed to go back and fix the expression. (If you get an error, refer to TeleMagic's on-line help for more complete information on building expressions.)
