

## Appearance Property (ActiveX Controls)

{ewc HLP95EN.DLL,DYNALINK,"See Also":"vbproAuto3DACTIVEXCONTROLSC;vbproBooksOnlineJumpTopic"} {ewc HLP95EN.DLL,DYNALINK,"Example":"vbproAuto3DActiveXControlsX":1} {ewc HLP95EN.DLL,DYNALINK,"Applies To":"vbproAuto3DActiveXControlsA"} {ewc HLP95EN.DLL,DYNALINK,"Specifics":"vbproAuto3DActiveXControlsS"}

Returns or sets the paint style of controls on an **MDIForm** or **Form** object at design time. Read-only at run time.

### Syntax

*object*.**Appearance**

The *object* placeholder represents an object expression that evaluates to an object in the Applies To list.

### Settings

The **Appearance** property settings are:

Setting	Description
0	Flat. Paints controls and forms without visual effects.
1	(Default) 3D. Paints controls with three-dimensional effects.

### Remarks

If set to 1 at design time, the **Appearance** property draws controls with three-dimensional effects. If the form's **BorderStyle** property is set to Fixed Double (**vbFixedDouble**, or 3), the caption and border of the form are also painted with three-dimensional effects. Setting the **Appearance** property to 1 also causes the form and its controls to have their **BackColor** property set to the color selected for Button Face in the Color option of the operating system's Control Panel.

Setting the **Appearance** property to 1 for an **MDIForm** object affects only the MDI parent form. To have three-dimensional effects on MDI child forms, you must set each child form's **Appearance** property to 1.

# BackColor, ForeColor Properties (ActiveX Controls)

{ewc HLP95EN.DLL,DYNALINK,"See Also":"vbproBackColorActiveXControlsC;vbproBooksOnlineJumpTopic"} {ewc HLP95EN.DLL,DYNALINK,"Example":"vbproBackColorActiveXControlsX":1} {ewc HLP95EN.DLL,DYNALINK,"Applies To":"vbproBackColorActiveXControlsA"} {ewc HLP95EN.DLL,DYNALINK,"Specifics":"vbproBackColorActiveXControlsS"}

- **BackColor** — returns or sets the background color of an object.
- **ForeColor** — returns or sets the foreground color used to display text and graphics in an object.

## Syntax

*object*.**BackColor** [= *color*]

*object*.**ForeColor** [= *color*]

The **BackColor** and **ForeColor** property syntaxes have these parts:

Part	Description
<i>object</i>	An <u>object expression</u> that evaluates to an object in the Applies To list.
<i>color</i>	A value or <u>constant</u> that determines the background or foreground colors of an object, as described in Settings.

## Settings

Visual Basic uses the Microsoft Windows operating environment red-green-blue (RGB) color scheme. The settings for *color* are:

Setting	Description
Normal RGB colors	Colors specified by using the Color palette or by using the <b>RGB</b> or <b>QBColor</b> functions in code.
System default colors	Colors specified by system color constants listed in the Visual Basic (VB) <u>object library</u> in the <u>Object Browser</u> . The Windows operating environment substitutes the user's choices as specified in the <u>Control Panel</u> settings.

For all forms and controls, the default settings at design time are:

- **BackColor** — set to the system default color specified by the constant **vbWindowBackground**.
- **ForeColor** — set to the system default color specified by the constant **vbWindowText**.

## Remarks

In the **Label**, and **Shape**, controls, the **BackColor** property is ignored if the **BackStyle** property setting is 0 (Transparent).

If you set the **BackColor** property on a **Form** object or a **PictureBox** control, all text and graphics, including the persistent graphics, are erased. Setting the **ForeColor** property doesn't affect graphics or print output already drawn. On all other controls, the screen color changes immediately.

The valid range for a normal RGB color is 0 to 16,777,215 (&HFFFFFF). The high byte of a number in this range equals 0; the lower 3 bytes, from least to most significant byte, determine the amount of red, green, and blue, respectively. The red, green, and blue components are each represented by a number between 0 and 255 (&HFF). If the high byte isn't 0, Visual Basic uses the system colors, as defined in the user's Control Panel settings and by constants listed in the Visual Basic (VB) object library in the Object Browser.

To display text in the Windows operating environment, both the text and background colors must be

solid. If the text or background colors you've selected aren't displayed, one of the selected colors may be dithered — that is, comprised of up to three different-colored pixels. If you choose a dithered color for either the text or background, the nearest solid color will be substituted.

**Note** The **Animation** control displays only two types of AVI files, either uncompressed or compressed in RLE8 format. AVI files compressed with RLE8 display only 8-bit colors. The BackColor property for the **Animation** control is "rounded" to the closest 8-bit color in the standard palette.

## BorderStyle Property (ActiveX Controls)

{ewc HLP95EN.DLL,DYNALINK,"See Also":"vbproBooksOnlineJumpTopic;vbproBorderStyleActiveXControlsC"} {ewc  
HLP95EN.DLL,DYNALINK,"Example":"vbproBorderStyleActiveXControlsX":1} {ewc  
HLP95EN.DLL,DYNALINK,"Applies To":"vbproBorderStyleActiveXControlsA"} {ewc  
HLP95EN.DLL,DYNALINK,"Specifics":"vbproBorderStyleActiveXControlsS"}

Returns or sets the border style for an object. For the **Form** object and the **TextBox** control, read-only at run time.

### Syntax

*object*.**BorderStyle** = [*value*]

The **BorderStyle** property syntax has these parts:

Part	Description
<i>object</i>	An <u>object expression</u> that evaluates to an object in the Applies To list.
<i>value</i>	A value or <u>constant</u> that determines the border style, as described in Settings.

### Settings

The **BorderStyle** property settings for a **Form** object are:

Constant	Setting	Description
<b>vbBSNone</b>	0	None (no border or border-related elements).
<b>VbFixedSingle</b>	1	Fixed Single. Can include Control-menu box, <u>title bar</u> , <u>Maximize button</u> , and <u>Minimize button</u> . Resizable only using Maximize and Minimize buttons.
<b>VbSizable</b>	2	(Default) Sizable. Resizable using any of the optional border elements listed for setting 1.
<b>VbFixedDouble</b>	3	Fixed Dialog. Can include Control-menu box and title bar; can't include Maximize or Minimize buttons. Not resizable.
<b>VbFixedToolWindow</b>	4	Fixed ToolWindow. Under Windows 3.x and Windows NT 3.51 and earlier, behaves like Fixed Single. Does not display Maximize or Minimize buttons. Not resizable. Under Windows 95, displays the Close button and displays the title bar text in a reduced font size. The form does not appear in the Windows 95 task bar.
<b>VbSizableToolWindow</b>	5	Sizable ToolWindow. Under Windows 3.x and Windows NT 3.51 and earlier, behaves like Sizable. Does not display Maximize or Minimize buttons. Resizable. Under Windows 95, displays the Close

button and displays the title bar text in a reduced font size. The form does not appear in the Windows 95 task bar.

The **BorderStyle** property settings for **MS Flex Grid**, **Image**, **Label**, **OLE** container, **PictureBox**, **Frame**, and **TextBox** controls are:

<b>Setting</b>	<b>Description</b>
0	(Default for <b>Image</b> and <b>Label</b> controls) None.
1	(Default for <b>MS Flex Grid</b> , <b>PictureBox</b> , <b>TextBox</b> , and <b>OLE</b> container controls) Fixed Single.

The **BorderStyle** property settings for **Line** and **Shape** controls are:

<b>Constant</b>	<b>Setting</b>	<b>Description</b>
<b>vbTransparent</b>	0	Transparent
<b>vbBSSolid</b>	1	(Default) Solid. The border is centered on the edge of the shape.
<b>vbBSDash</b>	2	Dash
<b>vbBSDot</b>	3	Dot
<b>vbBSDashDot</b>	4	Dash-dot
<b>vbBSDashDotDot</b>	5	Dash-dot-dot
<b>vbBSInsideSolid</b>	6	Inside solid. The outer edge of the border is the outer edge of the shape.

### Remarks

For a form, the **BorderStyle** property determines key characteristics that visually identify a form as either a general-purpose window or a dialog box. Setting 3 (Fixed Dialog) is useful for standard dialog boxes. Settings 4 (Fixed ToolWindow) and 5 (Sizable ToolWindow) are useful for creating toolbox-style windows.

MDI child forms set to 2 (Sizable) are displayed within the MDI form in a default size defined by the Windows operating environment at run time. For any other setting, the form is displayed in the size specified at design time.

Changing the setting of the **BorderStyle** property of a **Form** object may change the settings of the **MinButton**, **MaxButton**, and **ShowInTaskbar** properties. When **BorderStyle** is set to 1 (Fixed Single) or 2 (Sizable), the **MinButton**, **MaxButton**, and **ShowInTaskbar** properties are automatically set to **True**. When **BorderStyle** is set to 0 (None), 3 (Fixed Dialog), 4 (Fixed ToolWindow), or 5 (Sizable ToolWindow), the **MinButton**, **MaxButton**, and **ShowInTaskbar** properties are automatically set to **False**.

**Note** If a form with a menu is set to 3 (Fixed Dialog), it is displayed with a setting 1 (Fixed Single) border instead.

At run time, a form is either modal or modeless, which you specify using the **Show** method.

## BorderStyle Constants (ActiveX Controls)

{ewc HLP95EN.DLL,DYNALINK,"See

Also": "vbidxBorderStyleConstantsACTIVEXCONTROLSC;vbproBooksOnlineJumpTopic"}

<b>Constant</b>	<b>Value</b>	<b>Description</b>
<b>ccNone</b>	0	(Default) No border or border-related elements.
<b>ccFixedSingle</b>	1	(Default for <b>ListView</b> control) Fixed single. There is a single line border around the control.

**Note** The cc prefix refers to the custom controls. The prefixes for the constants change with the specific control or group of controls. However, the description remains the same unless indicated.

## Caption Property (ActiveX Controls)

{ewc HLP95EN.DLL,DYNALINK,"See Also":"vbproBooksOnlineJumpTopic;vbproCaptionActiveXControlsC"} {ewc HLP95EN.DLL,DYNALINK,"Example":"vbproCaptionActiveXControlsX":1} {ewc HLP95EN.DLL,DYNALINK,"Applies To":"vbproCaptionActiveXControlsA"} {ewc HLP95EN.DLL,DYNALINK,"Specifics":"vbproCaptionActiveXControlsS"}

- **Form** — determines the text displayed in the **Form** or **MDIForm** object's title bar . When the form is minimized, this text is displayed below the form's icon.
- **Control** — determines the text displayed in or next to a control.
- **MenuLine** object — determines the text displayed for a **Menu** control or an object in the **MenuItems** collection.

For a **Menu** control, **Caption** is normally read/write at run time. But **Caption** is read-only for menus that are exposed or supplied by Visual Basic to add-ins, such as the **MenuLine** object.

### Syntax

*object*.Caption [= *string*]

The **Caption** property syntax has these parts:

Part	Description
<i>object</i>	An <u>object expression</u> that evaluates to an object in the Applies To list. If <i>object</i> is omitted, the form associated with the active form <u>module</u> is assumed to be <i>object</i> .
<i>string</i>	A <u>string expression</u> that evaluates to the text displayed as the caption.

### Remarks

When you create a new object, its default caption is the default **Name** property setting. This default caption includes the object name and an integer, such as Command1 or Form1. For a more descriptive label, set the **Caption** property.

You can use the **Caption** property to assign an access key to a control. In the caption, include an ampersand (&) immediately preceding the character you want to designate as an access key. The character is underlined. Press the ALT key plus the underlined character to move the focus to that control. To include an ampersand in a caption without creating an access key, include two ampersands (&&). A single ampersand is displayed in the caption and no characters are underlined.

A **Label** control's caption size is unlimited. For forms and all other controls that have captions, the limit is 255 characters.

To display the caption for a form, set the **BorderStyle** property to either Fixed Single (1 or **vbFixedSingle**), Sizable (2 or **vbSizable**), or Fixed Double (3 or **vbFixedDouble**). A caption too long for the form's title bar is clipped. When an MDI child form is maximized within an **MDIForm** object, the child form's caption is included in the parent form's caption.

**Tip** For a label, set the **AutoSize** property to **True** to automatically resize the control to fit its caption.

# Change Event (ActiveX Controls)

```
{ewc HLP95EN.DLL,DYNALINK,"See Also":"vbevtChangeACTIVEXCONTROLSC;vbproBooksOnlineJumpTopic"} {ewc  
HLP95EN.DLL,DYNALINK,"Example":"vbevtChangeActiveXControlsX":1} {ewc HLP95EN.DLL,DYNALINK,"Applies  
To":"vbevtChangeActiveXControlsA"} {ewc HLP95EN.DLL,DYNALINK,"Specifics":"vbevtChangeActiveXControlsS"}
```

Indicates the contents of a control have changed. How and when this event occurs varies with the control:

- **ComboBox** — changes the text in the text box portion of the control. Occurs only if the **Style** property is set to 0 (Dropdown Combo) or 1 (Simple Combo) and the user changes the text or you change the **Text** property setting through code.
- **DirListBox** — changes the selected directory. Occurs when the user double-clicks a new directory or when you change the **Path** property setting through code.
- **DriveListBox** — changes the selected drive. Occurs when the user selects a new drive or when you change the **Drive** property setting through code.
- **HScrollBar** and **VScrollBar** (horizontal and vertical scroll bars) — move the scroll box portion of the scroll bar. Occurs when the user scrolls or when you change the **Value** property setting through code.
- **Label** — changes the contents of the **Label**. Occurs when a DDE link updates data or when you change the **Caption** property setting through code.
- **PictureBox** — changes the contents of the **PictureBox**. Occurs when a DDE link updates data or when you change the **Picture** property setting through code.
- **TextBox** — changes the contents of the text box. Occurs when a DDE link updates data, when a user changes the text, or when you change the **Text** property setting through code.

## Syntax

```
Private Sub object_Change([index As Integer])
```

The Change event syntax has these parts:

Part	Description
<i>object</i>	An <u>object expression</u> that evaluates to an object in the Applies To list.
<i>index</i>	An integer that uniquely identifies a control if it's in a <u>control array</u>

## Remarks

The Change event procedure can synchronize or coordinate data display among controls. For example, you can use a scroll bar's Change event procedure to update the scroll bar's **Value** property setting in a **TextBox** control. Or you can use a Change event procedure to display data and formulas in a work area and results in another area.

Change event procedures are also useful for updating properties in file-system controls (**DirListBox**, **DriveListBox**, and **FileListBox**). For example, you can update the **Path** property setting for a **DirListBox** control to reflect a change in a **DriveListBox** control's **Drive** property setting.

**Note** A Change event procedure can sometimes cause a cascading event. This occurs when the control's Change event alters the control's contents, for example, by setting a property in code that determines the control's value, such as the **Text** property setting for a **TextBox** control. To prevent a cascading event:

- If possible, avoid writing a Change event procedure for a control that alters that control's contents. If you do write such a procedure, be sure to set a flag that prevents further changes while the current change is in progress.
- Avoid creating two or more controls whose Change event procedures affect each other, for

example, two **TextBox** controls that update each other during their Change events.

- Avoid using a **MsgBox** function or statement in this event for **HScrollBar** and **VScrollBar** controls.

## Clear Method (ActiveX Controls)

```
{ewc HLP95EN.DLL,DYNALINK,"See Also":"vbmthClearObjectACTIVEXCONTROLSC;vbproBooksOnlineJumpTopic"}  
{ewc HLP95EN.DLL,DYNALINK,"Example":"vbmthClearMethodX;vbmthClearObjectsActiveXControlsX":1} {ewc  
HLP95EN.DLL,DYNALINK,"Applies To":"vbmthClearObjectsActiveXControlsA"} {ewc  
HLP95EN.DLL,DYNALINK,"Specifics":"vbmthClearObjectsActiveXControlsS"}
```

Removes all objects in a collection.

### Syntax

*object*.**Clear**

The *object* placeholder represents an object expression that evaluates to an object in the Applies To list.

### Remarks

To remove only one object from a collection, use the **Remove** method.

## Clear Method (ActiveX Controls) Example

This example adds six **Panel** objects to a **StatusBar** control, creating a total of seven **Panel** objects. A click on the form clears all **Panel** objects when their number reaches seven. If the number of **Panel** objects is less than seven, each click on the form will add a new **Panel** object to the control until the number seven is once again reached. To try the example, place a **StatusBar** control on a form and paste the code into the Declarations section. Run the example and click on the form to clear all **Panel** objects and subsequently add **Panel** objects.

```
Private Sub Form_Load()  
    Dim pnlX As Panel ' Declare object variable for Panel objects.  
    Dim I As Integer  
  
    ' Add 6 Panel objects to the single default Panel object,  
    ' making 7 Panel objects.  
    For I = 1 to 6  
        Set pnlX = StatusBar1.Panels.Add  
    Next I  
End Sub  
  
Private Sub Form_Click()  
    ' If the Count of the collection is 7, then clear the collection.  
    ' Otherwise, add one Panel and use the collection's Count property  
    ' to set its Style.  
    If StatusBar1.Panels.Count = 7 Then  
        StatusBar1.Panels.Clear  
    Else  
        Dim pnlX As Panel  
        Set pnlX = StatusBar1.Panels.Add( , , "simple", 0)  
        ' The Style property is enumerated from 0 to 6. Use the Panels  
        ' Count property -1 to set the Style property for the new Panel.  
        ' Display all panels regardless of form width.  
        pnlX.minwidth = TextWidth("simple")  
        pnlX.AutoSize = sbrSpring  
        pnlX.Style = StatusBar1.Panels.Count - 1  
    End If  
End Sub
```

## Click Event (ActiveX Controls)

```
{ewc HLP95EN.DLL,DYNALINK,"See Also":"vbevtClickACTIVEXCONTROLSC;vbproBooksOnlineJumpTopic"} {ewc  
HLP95EN.DLL,DYNALINK,"Example":"vbevtClickActiveXControlsX":1} {ewc HLP95EN.DLL,DYNALINK,"Applies  
To":"vbevtClickActiveXControlsA"} {ewc HLP95EN.DLL,DYNALINK,"Specifics":"vbevtClickActiveXControlsS"}
```

Occurs when the user presses and then releases a mouse button over an object. It can also occur when the value of a control is changed.

For a **Form** object, this event occurs when the user clicks either a blank area or a disabled control. For a control, this event occurs when the user:

- Clicks a control with the left or right mouse button. With a **CheckBox**, **CommandButton**, **Listbox**, or **OptionButton** control, the Click event occurs only when the user clicks the left mouse button.
- Selects an item in a **ComboBox** or **Listbox** control, either by pressing the arrow keys or by clicking the mouse button.
- Presses the SPACEBAR when a **CommandButton**, **OptionButton**, or **CheckBox** control has the focus.
- Presses ENTER when a form has a **CommandButton** control with its **Default** property set to **True**.
- Presses ESC when a form has a Cancel button — a **CommandButton** control with its **Cancel** property set to **True**.
- Presses an access key for a control. For example, if the caption of a **CommandButton** control is "&Go", pressing ALT+G triggers the event.

You can also trigger the Click event in code by:

- Setting a **CommandButton** control's **Value** property to **True**.
- Setting an **OptionButton** control's **Value** property to **True**.
- Changing a **CheckBox** control's **Value** property setting.

### Syntax

```
Private Sub Form_Click( )  
Private Sub object_Click([index As Integer])
```

The Click event syntax has these parts:

Part	Description
<i>object</i>	An <u>object expression</u> that evaluates to an object in the Applies To list.
<i>index</i>	An integer that uniquely identifies a control if it's in a <u>control array</u> .

### Remarks

Typically, you attach a Click event procedure to a **CommandButton** control, **Menu** object, or **PictureBox** control to carry out commands and command-like actions. For the other applicable controls, use this event to trigger actions in response to a change in the control.

You can use a control's **Value** property to test the state of the control from code. Clicking a control generates MouseDown and MouseUp events in addition to the Click event. The order in which these three events occur varies from control to control. For example, for **Listbox** and **CommandButton** controls, the events occur in this order: MouseDown, Click, MouseUp. But for **FileListBox**, **Label**, or **PictureBox** controls, the events occur in this order: MouseDown, MouseUp, and Click. When you're attaching event procedures for these related events, be sure that their actions don't conflict. If the order of events is important in your application, test the control to determine the event order.

**Note** To distinguish between the left, right, and middle mouse buttons, use the MouseDown and MouseUp events.

If there is code in the Click event, the DblClick event will never trigger, because the Click event is the first event to trigger between the two. As a result, the mouse click is intercepted by the Click event, so the DblClick event doesn't occur.

## Clipboard Object Constants (ActiveX Controls)

{ewc HLP95EN.DLL,DYNALINK,"See Also": "vbidxClipboardConstantsACTIVEXCONTROLSC;vbproBooksOnlineJumpTopic"}

<b>Constant</b>	<b>Value</b>	<b>Description</b>
<b>vbCFLink</b>	&HBF00	DDE conversation information
<b>vbCFRTF</b>	&HBF01	Rich Text Format (.rtf file)
<b>vbCFText</b>	1	Text (.txt file)
<b>vbCFBitmap</b>	2	Bitmap (.bmp file)
<b>vbCFMetafile</b>	3	Metafile (.wmf file)
<b>vbCFDIB</b>	8	Device-independent bitmap
<b>vbCFPalette</b>	9	Color palette

## Count Property (ActiveX Controls)

{ewc HLP95EN.DLL,DYNALINK,"See Also":"vbproBooksOnlineJumpTopic;vbproCountActiveXControlsC"} {ewc HLP95EN.DLL,DYNALINK,"Example":"vbproCountActiveXControlsX":1} {ewc HLP95EN.DLL,DYNALINK,"Applies To":"vbproCountActiveXControlsA"} {ewc HLP95EN.DLL,DYNALINK,"Specifics":"vbproCountActiveXControlsS"}

Returns the number of objects in a collection.

### Syntax

*object*.Count

The *object* placeholder is an object expression that evaluates to an object in the Applies To list.

### Remarks

You can use this property with a **For...Next** statement to carry out an operation on the forms or controls in a collection. For example, the following code moves all controls on a form 0.5 inches to the right (**ScaleMode** property setting is 1 or **vbTwips**):

```
For I = 0 To Form1.Controls.Count - 1
    Form1.Controls(I).Left = Form1.Controls(I).Left + 720
Next I
```

You can also use this kind of structure to quickly enable or disable all controls on a form.

When used with the **If TypeOf** statement, you can cycle through all controls and change, for example, the **Enabled** property setting of only the text boxes or the **BackColor** property setting of only the option buttons.

## Enabled Property (ActiveX Controls)

{ewc HLP95EN.DLL,DYNALINK,"See Also":"vbproBooksOnlineJumpTopic;vbproEnabledActiveXControlsC"} {ewc HLP95EN.DLL,DYNALINK,"Example":"vbproEnabledActiveXControlsX":1} {ewc HLP95EN.DLL,DYNALINK,"Applies To":"vbproEnabledActiveXControlsA"} {ewc HLP95EN.DLL,DYNALINK,"Specifics":"vbproEnabledActiveXControlsS"}

Returns or sets a value that determines whether a form or control can respond to user-generated events.

### Syntax

*object*.**Enabled** [= *boolean*]

The **Enabled** property syntax has these parts:

<b>Part</b>	<b>Description</b>
<i>object</i>	An <u>object expression</u> that evaluates to an object in the Applies To list. If <i>object</i> is omitted, the form associated with the active form <u>module</u> is assumed to be <i>object</i> .
<i>boolean</i>	A <u>Boolean expression</u> that specifies whether <i>object</i> can respond to user-generated events.

### Settings

The settings for *boolean* are:

<b>Setting</b>	<b>Description</b>
<b>True</b>	(Default) Allows <i>object</i> to respond to events.
<b>False</b>	Prevents <i>object</i> from responding to events.

### Remarks

The **Enabled** property allows forms and controls to be enabled or disabled at run time. For example, you can disable objects that don't apply to the current state of the application. You can also disable a control used purely for display purposes, such as a text box that provides read-only information.

Disabling a **Timer** control by setting **Enabled** to **False** cancels the countdown set up by the control's **Interval** property.

For a **Menu** control, **Enabled** is normally read/write at run time. But **Enabled** is read-only for menu items that are exposed or supplied by Visual Basic to add-ins, such as the Add-In Manager command on the Add-Ins menu.

## DataObject Object (ActiveX Controls)

```
{ewc HLP95EN.DLL,DYNALINK,"See Also":"vbobjDataObjectACTIVEXCONTROLSC;vbproBooksOnlineJumpTopic"}
{ewc HLP95EN.DLL,DYNALINK,"Example":"vbobjDataObjectActiveXControlsX":1} {ewc
HLP95EN.DLL,DYNALINK,"Properties":"vbobjDataObjectActiveXControlsP"} {ewc
HLP95EN.DLL,DYNALINK,"Methods":"vbobjDataObjectActiveXControlsM"} {ewc
HLP95EN.DLL,DYNALINK,"Events":"vbobjDataObjectActiveXControlsE"} {ewc
HLP95EN.DLL,DYNALINK,"Specifics":"vbobjDataObjectActiveXControlsS"}
```

The **DataObject** object is a container for data being transferred from an component source to an component target. The data is stored in the format defined by the method using the **DataObject** object.

### Syntax

#### DataObject

### Remarks

The **DataObject**, which mirrors the **IDataObject** interface, allows OLE drag and drop and clipboard operations to be implemented.

Most components support manual OLE drag and drop events, and some support automatic OLE drag and drop events.

## DataObjectFiles Collection (ActiveX Controls)

```
{ewc HLP95EN.DLL,DYNALINK,"See Also":"vbcolDataObjectFilesACTIVEXCONTROLSC;vbproBooksOnlineJumpTopic"}
{ewc HLP95EN.DLL,DYNALINK,"Example":"vbcolDataObjectFilesActiveXControlsX":1} {ewc
HLP95EN.DLL,DYNALINK,"Properties":"vamthItem;vbcolDataObjectFilesActiveXControlsP"} {ewc
HLP95EN.DLL,DYNALINK,"Methods":"vamthAdd;vbcolDataObjectFilesActiveXControlsM"} {ewc
HLP95EN.DLL,DYNALINK,"Events":"vbcolDataObjectFilesActiveXControlsE"} {ewc
HLP95EN.DLL,DYNALINK,"Specifics":"vbcolDataObjectFilesActiveXControlsS"}
```

A collection whose elements represent a list of all filenames used by a **DataObject** object (such as the names of files that a user drags to or from the Windows File Explorer.)

### Syntax

*object*.**DataObjectFiles**(*index*)

The **DataObjectFiles** collection syntax has these parts:

<b>Part</b>	<b>Description</b>
<i>object</i>	An <u>object expression</u> that evaluates to a <b>DataObject</b> object.
<i>index</i>	An integer with a range from 0 to <code>DataObjectFiles.Count - 1</code> .

### Remarks

**Note** This collection is used by the **Files** property only when the data in the **DataObject** object is in the **vbCFFiles** format.

The **DataObjectFiles** collection is used by the **Files** property to store filenames in a **DataObject** object. It includes the **Remove**, **Add**, and **Clear** methods which allow you to manipulate its contents.

## DataSource Property (ActiveX Controls)

```
{ewc HLP95EN.DLL,DYNALINK,"See Also":"vbproBooksOnlineJumpTopic;vbproDataSourceActiveXControlsC"} {ewc  
HLP95EN.DLL,DYNALINK,"Example":"vbproDataSourceActiveXControlsX":1} {ewc  
HLP95EN.DLL,DYNALINK,"Applies To":"vbproDataSourceActiveXControlsA"} {ewc  
HLP95EN.DLL,DYNALINK,"Specifics":"vbproDataSourceActiveXControlsS"}
```

Sets a value that specifies the **Data** control through which the current control is bound to a database. Not available at run time.

### Remarks

To bind a control to a field in a database at run time, you must specify a **Data** control in the **DataSource** property at design time using the Properties window.

To complete the connection with a field in the **Recordset** managed by the **Data** control, you must also provide the name of a **Field** object in the **DataField** property. Unlike the **DataField** property, the **DataSource** property setting isn't available at run time.

### Data Type

String

## DbIcIck Event (ActiveX Controls)

```
{ewc HLP95EN.DLL,DYNALINK,"See Also":"formDbIcIckSee;vbproBooksOnlineJumpTopic"} {ewc  
HLP95EN.DLL,DYNALINK,"Example":"vbevtdbIcIckActiveXControlsX":1} {ewc HLP95EN.DLL,DYNALINK,"Applies  
To":"formDbIcIckActiveXControlsA"} {ewc HLP95EN.DLL,DYNALINK,"Specifics":"vbevtdbIcIckActiveXControlsS"}
```

Occurs when the user presses and releases a mouse button and then presses and releases it again over an object.

For a form, the DbIcIck event occurs when the user double-clicks a disabled control or a blank area of a form. For a control, it occurs when the user:

- Double-clicks a control with the left mouse button.
- Double-clicks an item in a **ComboBox** control whose **Style** property is set to 1 (Simple) or in a **FileListBox**, **ListBox**, **DBCombo**, or **DBList** control.

### Syntax

```
Private Sub Form_DbIcIck ( )  
Private Sub object_DbIcIck (index As Integer)
```

Part	Description
<i>object</i>	An <u>object expression</u> that evaluates to an object in the Applies To list.
<i>index</i>	Identifies the control if it's in a <u>control array</u> .

### Remarks

The argument *Index* uniquely identifies a control if it's in a control array. You can use a DbIcIck event procedure for an implied action, such as double-clicking an icon to open a window or document. You can also use this type of procedure to carry out multiple steps with a single action, such as double-clicking to select an item in a list box and to close the dialog box.

To produce such shortcut effects in Visual Basic, you can use a DbIcIck event procedure for a list box or file list box in tandem with a default button — a **CommandButton** control with its **Default** property set to **True**. As part of the DbIcIck event procedure for the list box, you simply call the default button's Click event.

For those objects that receive Mouse events, the events occur in this order: MouseDown, MouseUp, Click, DbIcIck, and MouseUp.

If DbIcIck doesn't occur within the system's double-click time limit, the object recognizes another Click event. The double-click time limit may vary because the user can set the double-click speed in the Control Panel. When you're attaching procedures for these related events, be sure that their actions don't conflict. Controls that don't receive DbIcIck events may receive two clicks instead of a DbIcIck.

**Note** To distinguish between the left, right, and middle mouse buttons, use the MouseDown and MouseUp events.

If there is code in the Click event, the DbIcIck event will never trigger.

## DblClick Event (ActiveX Controls) Example

This example displays a selected list item in a **TextBox** control when either a **CommandButton** control is clicked or a list item is double-clicked. To try this example, paste the code into the Declarations section of a **Form** object that contains a **ListBox** control, a **TextBox** control, and a **CommandButton** control. Then run the example and click the **CommandButton** control or double-click an item in the **ListBox** control.

```
Private Sub Form_Load ()
    List1.AddItem "John" ' Add list box entries.
    List1.AddItem "Paul"
    List1.AddItem "George"
    List1.AddItem "Ringo"
End Sub

Private Sub List1_DblClick ()
    Command1.Value = True ' Trigger Click event.
End Sub

Private Sub Command1_Click ()
    Text1.Text = List1.Text ' Display selection.
End Sub
```

## Drag-and-Drop Constants (ActiveX Controls)

{ewc HLP95EN.DLL,DYNALINK,"See

Also": "vbidxDragandDropConstantsACTIVEXCONTROLSC;vbproBooksOnlineJumpTopic"}

### DragOver Event

<b>Constant</b>	<b>Value</b>	<b>Description</b>
<b>vbEnter</b>	0	Source control dragged into target
<b>vbLeave</b>	1	Source control dragged out of target
<b>vbOver</b>	2	Source control dragged from one position in target to another

### Drag Method (Controls)

<b>Constant</b>	<b>Value</b>	<b>Description</b>
<b>vbCancel</b>	0	Cancel drag operation
<b>vbBeginDrag</b>	1	Begin dragging control
<b>vbEndDrag</b>	2	Drop control

### DragMode Property

<b>Constant</b>	<b>Value</b>	<b>Description</b>
<b>vbManual</b>	0	Manual
<b>vbAutomatic</b>	1	Automatic

## FetchVerbs Method (ActiveX Controls)

```
{ewc HLP95EN.DLL,DYNALINK,"See Also":"vbmthFetchVerbsACTIVEXCONTROLSC;vbproBooksOnlineJumpTopic"}  
{ewc HLP95EN.DLL,DYNALINK,"Example":"vbmthFetchVerbsActiveXControlsX":1} {ewc  
HLP95EN.DLL,DYNALINK,"Applies To":"vbmthFetchVerbsActiveXControlsA"} {ewc  
HLP95EN.DLL,DYNALINK,"Specifics":"vbmthFetchVerbsActiveXControlsS"}
```

Updates the list of verbs an object supports.

### Syntax

*object*.**FetchVerbs**

The *object* is an object expression that evaluates to an object in the Applies To list.

### Remarks

You can read the updated list of verbs using the **ObjectVerbs** property.

## Files Method (ActiveX Controls)

```
{ewc HLP95EN.DLL,DYNALINK,"See Also":"vbmthFilesMethodACTIVEXCONTROLSC;vbproBooksOnlineJumpTopic"}
{ewc HLP95EN.DLL,DYNALINK,"Example":"vbmthFilesMethodActiveXControlsX":1} {ewc
HLP95EN.DLL,DYNALINK,"Applies To":"vbmthFilesMethodActiveXControlsA"} {ewc
HLP95EN.DLL,DYNALINK,"Specifics":"vbmthFilesMethodActiveXControlsS"}
```

Returns a collection of filenames used by the vbCFFiles format (a **DataObjectFiles** collection) which in turn contains a list of all filenames used by a **DataObject** object; for example, the names of files that a user drags to or from the Windows File Explorer.

### Syntax

*object.Files(index)*

The **Files** collection syntax has these parts:

<b>Part</b>	<b>Description</b>
<i>object</i>	An <u>object expression</u> that evaluates to a <b>DataObject</b> object.
<i>index</i>	An integer which is an index to an array of filenames.

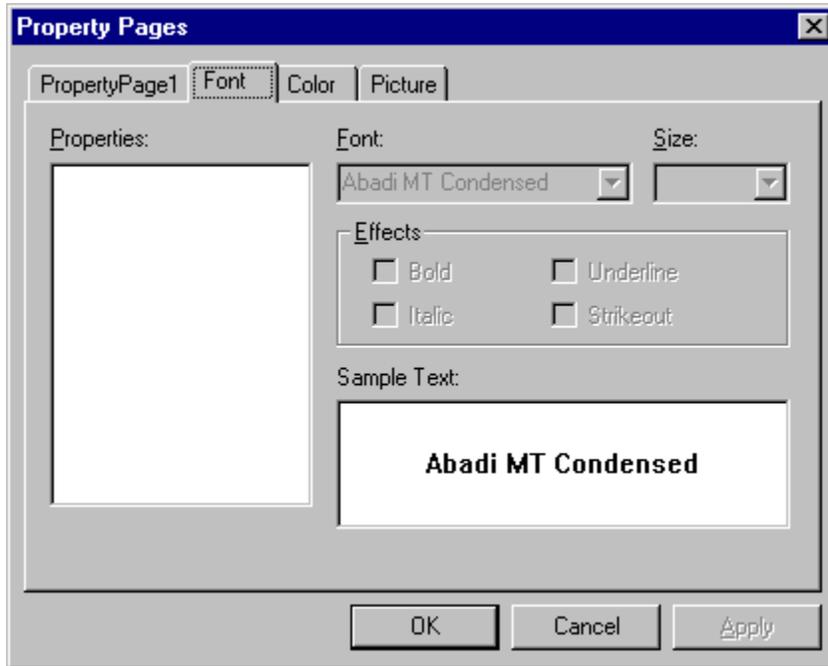

### Remarks

The **Files** collection is filled with filenames only when the **DataObject** object contains data of type **vbCFFiles**. The **DataObject** object can contain several different types of data. You can iterate through the collection to retrieve the list of file names.

The **Files** collection can be filled to allow Visual Basic applications to act as a drag source for a list of files.

## Property Pages Dialog Box (ActiveX Controls)

{ewc HLP95EN.DLL,DYNALINK,"See Also":"vbdlgPropertyPagesDialogACTIVEXCONTROLSC;vbproBooksOnlineJumpTopic"}  
{ewc HLP95EN.DLL,DYNALINK,"Specifics":"vbdlgPropertyPagesDialogActiveXControlsS"}

Allows you to change a control's properties at design time.

### Dialog Box Options

**Tab** Visual Basic creates a tabbed dialog box that acts like form by writing code to handle updating property values when a user changes values in the control.

You can add Property Pages to your project using the Add Property Pages command on the Project menu.

**OK** Adds the Property Pages and closes the Property Pages dialog box.

**Apply** Adds the Property Page without closing the dialog box.

## No fonts exist (Error 24574) (Common Dialog Control)

{ewc HLP95EN.DLL,DYNALINK,"See  
Also":"vbmsgNoFontsExistError24574CommonDialogControlC:vbproBooksOnlineJumpTopic"} {ewc  
HLP95EN.DLL,DYNALINK,"Specifics":"vbmsgNoFontsExistError24574CommonDialogControlS"}

Before displaying the Choose Font dialog box, you must set one of the following flags:

- **ScreenFonts**
- **PrinterFonts**
- **Both**

## Font Property (ActiveX Controls)

{ewc HLP95EN.DLL,DYNALINK,"See Also": "vbproBooksOnlineJumpTopic;vbproFontActiveXControlsC"} {ewc HLP95EN.DLL,DYNALINK,"Example": "vbproFontActiveXControlsX":1} {ewc HLP95EN.DLL,DYNALINK,"Applies To": "vbproFontActiveXControlsA"} {ewc HLP95EN.DLL,DYNALINK,"Specifics": "vbproFontActiveXControlsS"}

Returns a **Font** object.

### Syntax

*object*.**Font**

The *object* placeholder represents an object expression that evaluates to an object in the Applies To list.

### Remarks

Use the **Font** property of an object to identify a specific **Font** object whose properties you want to use. For example, the following code changes the **Bold** property setting of a **Font** object identified by the **Font** property of a **TextBox** object:

```
txtFirstName.Font.Bold = True
```

## FontName Property (ActiveX Controls)

```
{ewc HLP95EN.DLL,DYNALINK,"See Also":"vbproBooksOnlineJumpTopic;vbproFontNameActiveXControlsC"} {ewc  
HLP95EN.DLL,DYNALINK,"Example":"vbproFontNameActiveXControlsX":1} {ewc HLP95EN.DLL,DYNALINK,"Applies  
To":"vbproFontNameActiveXControlsA"} {ewc  
HLP95EN.DLL,DYNALINK,"Specifics":"vbproFontNameActiveXControlsS"}
```

Returns or sets the font used to display text in a control or in a run-time drawing or printing operation.

**Note** The **FontName** property is included for use with the **CommonDialog** control and for compatibility with earlier versions of Visual Basic. For additional functionality, use the new **Font** object properties (not available for the **CommonDialog** control).

### Syntax

*object*.**FontName** [= *font*]

The **FontName** property syntax has these parts:

<b>Part</b>	<b>Description</b>
<i>object</i>	An <u>object expression</u> that evaluates to an object in the Applies To list.
<i>font</i>	A <u>string expression</u> specifying the font name to use.

### Remarks

The default for this property is determined by the system. Fonts available with Visual Basic vary depending on your system configuration, display devices, and printing devices. Font-related properties can be set only to values for which fonts exist.

In general, you should change **FontName** before setting size and style attributes with the **FontSize**, **FontBold**, **FontItalic**, **FontStrikethru**, and **FontUnderline** properties.

**Note** At run time, you can get information on fonts available to the system through the **FontCount** and **Fonts** properties.

## FontSize Property (ActiveX Controls)

{ewc HLP95EN.DLL,DYNALINK,"See Also":"vbproBooksOnlineJumpTopic;vbproFontSizeActiveXControlsC"} {ewc HLP95EN.DLL,DYNALINK,"Example":"vbproFontSizeActiveXControlsX":1} {ewc HLP95EN.DLL,DYNALINK,"Applies To":"vbproFontSizeActiveXControlsA"} {ewc HLP95EN.DLL,DYNALINK,"Specifics":"vbproFontSizeActiveXControlsS"}

Returns or sets the size of the font to be used for text displayed in a control or in a run-time drawing or printing operation.

**Note** The **FontSize** property is included for use with the **CommonDialog** control and for compatibility with earlier versions of Visual Basic. For additional functionality, use the new **Font** object properties (not available for the **CommonDialog** control).

### Syntax

*object*.FontSize [= *points*]

The **FontSize** property syntax has these parts:

<b>Part</b>	<b>Description</b>
<i>object</i>	An <u>object expression</u> that evaluates to an object in the <u>Applies To</u> list.
<i>points</i>	A <u>numeric expression</u> specifying the font size to use, in <u>points</u> .

### Remarks

Use this property to format text in the font size you want. The default is determined by the system. To change the default, specify the size of the font in points.

The maximum value for **FontSize** is 2160 points.

**Note** Fonts available with Visual Basic vary depending on your system configuration, display devices, and printing devices. Font-related properties can be set only to values for which fonts exist. In general, you should change the **FontName** property before you set size and style attributes with the **FontSize**, **FontBold**, **FontItalic**, **FontStrikethru**, and **FontUnderline** properties. However, when you set TrueType fonts to smaller than 8 points, you should set the point size with the **FontSize** property, then set the **FontName** property, and then set the size again with the **FontSize** property. The Microsoft Windows operating environment uses a different font for TrueType fonts that are smaller than 8 points.

## GetData Method (ActiveX Controls)

{ewc HLP95EN.DLL,DYNALINK,"See Also":"vbmthGetDataActiveXControlsC;vbproBooksOnlineJumpTopic"} {ewc HLP95EN.DLL,DYNALINK,"Example":"vbmthGetDataActiveXControlsX":1} {ewc HLP95EN.DLL,DYNALINK,"Applies To":"vbmthGetDataActiveXControlsA"} {ewc HLP95EN.DLL,DYNALINK,"Specifics":"vbmthGetDataActiveXControlsS"}

Returns a graphic from the **Clipboard** object. Doesn't support named arguments.

### Syntax

*object*.**GetData** (*format*)

The **GetData** method syntax has these parts:

Part	Description
<i>object</i>	Required. An <u>object expression</u> that evaluates to an object in the Applies To list.
<i>format</i>	Optional. A constant or value that specifies the <b>Clipboard</b> graphics format, as described in Settings. Parentheses must enclose the constant or value. If <i>format</i> is 0 or omitted, <b>GetData</b> automatically uses the appropriate format.

### Settings

The settings for *format* are:

Constant	Value	Description
<b>vbCFBitmap</b>	2	<u>Bitmap</u> (.bmp files)
<b>vbCFMetafile</b>	3	<u>metafile</u> (.wmf files)
<b>vbCFDIB</b>	8	Device-independent bitmap (DIB)
<b>vbCFPalette</b>	9	Color palette

### Remarks

These constants are listed in the Visual Basic (VB) object library in the Object Browser.

If no graphic on the **Clipboard** object matches the expected format, nothing is returned. If only a color palette is present on the **Clipboard** object, a minimum size (1 x 1) DIB is created.

## GetFormat Method (ActiveX Controls)

```
{ewc HLP95EN.DLL,DYNALINK,"See Also":"vbmthGetFormatActiveXControlsC;vbproBooksOnlineJumpTopic"} {ewc  
HLP95EN.DLL,DYNALINK,"Example":"vbmthGetFormatActiveXControlsX":1} {ewc HLP95EN.DLL,DYNALINK,"Applies  
To":"vbmthGetFormatActiveXControlsA"} {ewc  
HLP95EN.DLL,DYNALINK,"Specifics":"vbmthGetFormatActiveXControlsS;vbmthGetFormatS"}
```

Returns an integer indicating whether an item on the **Clipboard** object matches a specified format. Doesn't support named argument.

### Syntax

*object*.**GetFormat** (*format*)

The **GetFormat** method syntax has these parts:

Part	Description
<i>object</i>	Required. An <u>object expression</u> that evaluates to an object in the Applies To list.
<i>format</i>	Required. A value or constant that specifies the <b>Clipboard</b> object format, as described in Settings. Parentheses must enclose the constant or value.

### Settings

The settings for *format* are:

Constant	Value	Description
<b>vbCFLink</b>	&HBF00	DDE conversation information
<b>vbCFText</b>	1	Text
<b>vbCFBitmap</b>	2	<u>Bitmap</u> (.bmp files)
<b>vbCFMetafile</b>	3	<u>Metafile</u> (.wmf files)
<b>vbCFDIB</b>	8	Device-independent bitmap (DIB)
<b>vbCFPalette</b>	9	Color palette

### Remarks

These constants are listed in the Visual Basic (VB) object library in the Object Browser.

The **GetFormat** method returns **True** if an item on the **Clipboard** object matches the specified format. Otherwise, it returns **False**.

For **vbCFDIB** and **vbCFBitmap** formats, whatever color palette is on the **Clipboard** is used when the graphic is displayed.

## HideSelection Property (ActiveX Controls)

```
{ewc HLP95EN.DLL,DYNALINK,"See Also":":vbproBooksOnlineJumpTopic;vbproHideSelectionActiveXC"} {ewc  
HLP95EN.DLL,DYNALINK,"Example":":vbproHideSelectionActiveXX":1} {ewc HLP95EN.DLL,DYNALINK,"Applies  
To":":vbproHideSelectionActiveXA"} {ewc HLP95EN.DLL,DYNALINK,"Specifics":":vbproHideSelectionActiveXS"}
```

Returns a value that determines whether selected text appears highlighted when a control loses the focus.

### Syntax

*object*.**HideSelection**

The *object* placeholder represents an object expression that evaluates to an object in the Applies To list.

### Return Values

The **HideSelection** property return values are:

<b>Value</b>	<b>Description</b>
<b>True</b>	(Default) Selected text doesn't appear highlighted when the control loses the focus.
<b>False</b>	Selected text appears highlighted when the control loses the focus.

### Remarks

You can use this property to indicate which text is highlighted while another form or a dialog box has the focus — for example, in a spell-checking routine.

## hWnd Property (ActiveX Controls)

{ewc HLP95EN.DLL,DYNALINK,"See Also":"vbproBooksOnlineJumpTopic;vbprohWndActiveXControlsC"} {ewc HLP95EN.DLL,DYNALINK,"Example":"vbprohWndActiveXControlsX":1} {ewc HLP95EN.DLL,DYNALINK,"Applies To":"vbprohWndActiveXControlsA"} {ewc HLP95EN.DLL,DYNALINK,"Specifics":"vbprohWndActiveXControlsS"}

Returns a handle to a form or control.

**Note** This property is not supported for the **OLE** container control.

### Syntax

*object*.**hWnd**

The *object* placeholder represents an object expression that evaluates to an object in the Applies To list.

### Remarks

The Microsoft Windows operating environment identifies each form and control in an application by assigning it a handle, or **hWnd**. The **hWnd** property is used with Windows API calls. Many Windows operating environment functions require the **hWnd** of the active window as an argument.

**Note** Because the value of this property can change while a program is running, never store the **hWnd** value in a variable.

## Item Property (ActiveX Controls)

```
{ewc HLP95EN.DLL,DYNALINK,"See Also":"vbmthItemMethodActiveXControlsC;vbproBooksOnlineJumpTopic"} {ewc  
HLP95EN.DLL,DYNALINK,"Example":"vbmthItemMethodActiveXControlsX":1} {ewc  
HLP95EN.DLL,DYNALINK,"Applies To":"vbmthItemMethodActiveXControlsA"} {ewc  
HLP95EN.DLL,DYNALINK,"Specifics":"vbmthItemMethodActiveXControlsS"}
```

Returns a specific member of a **Collection** object either by position or by key.

### Syntax

*object*.**Item**( *index* )

The **Item** property syntax has the following object qualifier and part:

<b>Part</b>	<b>Description</b>
<i>object</i>	Required. An object expression that evaluates to an object in the Applies To list.
<i>index</i>	Required. An expression that specifies the position of a member of the collection. If a numeric expression, index must be a number from 1 to the value of the collection's Count property. If a string expression, index must correspond to the key argument specified when the member referred to was added to the collection.

### Remarks

If the value provided as index doesn't match any existing member of the collection, an error occurs.

**Item** is the default property for a collection. Therefore, the following lines of code are equivalent:

```
Print MyCollection(1)  
Print MyCollection.Item(1)
```

## Key Property (ActiveX Controls)

```
{ewc HLP95EN.DLL,DYNALINK,"See Also":"vbproBooksOnlineJumpTopic;vbproKeyActiveXControlsC"} {ewc  
HLP95EN.DLL,DYNALINK,"Example":"vbproKeyActiveXControlsX":1} {ewc HLP95EN.DLL,DYNALINK,"Applies  
To":"vbproKeyActiveXControlsA"} {ewc HLP95EN.DLL,DYNALINK,"Specifics":"vbproKeyActiveXControlsS"}
```

Returns or sets a string that uniquely identifies a member in a collection.

### Syntax

*object*.**Key** [= *string*]

The **Key** property syntax has these parts:

<b>Part</b>	<b>Description</b>
<i>object</i>	An <u>object expression</u> that evaluates to an object in the Applies To list.
<i>string</i>	A unique string identifying a member in a collection.

### Remarks

If the string is not unique, an error will occur.

You can set the **Key** property when you use the **Add** method to add an object to a collection.

The value of the **Index** property of an object can change when objects in the collection are reordered, such as when you set the **Sorted** property to **True**. If you expect the **Index** property to change dynamically, refer to objects in a collection using the **Key** property.

In addition, you can use the **Key** property to make your Visual Basic project "self-documenting" by assigning meaningful names to the objects in a collection.

## KeyDown, KeyUp Events (ActiveX Controls)

```
{ewc HLP95EN.DLL,DYNALINK,"See Also":"vbevtKeyDownActiveXControlsC;vbproBooksOnlineJumpTopic"} {ewc  
HLP95EN.DLL,DYNALINK,"Example":"vbevtKeyDownActiveXControlsX":1} {ewc HLP95EN.DLL,DYNALINK,"Applies  
To":"vbevtKeyDownActiveXControlsA"} {ewc HLP95EN.DLL,DYNALINK,"Specifics":"vbevtKeyDownActiveXControlsS"}
```

Occur when the user presses (KeyDown) or releases (KeyUp) a key while an object has the focus. (To interpret ANSI characters, use the KeyPress event.)

### Syntax

**Private Sub Form\_KeyDown(keycode As Integer, shift As Integer)**

**Private Sub object\_KeyDown([index As Integer,] keycode As Integer, shift As Integer)**

**Private Sub Form\_KeyUp(keycode As Integer, shift As Integer)**

**Private Sub object\_KeyUp([index As Integer,] keycode As Integer, shift As Integer)**

The KeyDown and KeyUp event syntaxes have these parts:

Part	Description
<i>object</i>	An <u>object expression</u> that evaluates to an object in the Applies To list.
<i>index</i>	An integer that uniquely identifies a control if it's in a <u>control array</u> .
<i>keycode</i>	A key code, such as <b>vbKeyF1</b> (the F1 key) or <b>vbKeyHome</b> (the HOME key). To specify key codes, use the constants in the Visual Basic (VB) <u>object library</u> in the <u>Object Browser</u> .
<i>shift</i>	An integer that corresponds to the state of the SHIFT, CTRL, and ALT keys at the time of the event. The <i>shift</i> argument is a bit field with the least-significant bits corresponding to the SHIFT key (bit 0), the CTRL key (bit 1), and the ALT key (bit 2). These bits correspond to the values 1, 2, and 4, respectively. Some, all, or none of the bits can be set, indicating that some, all, or none of the keys are pressed. For example, if both CTRL and ALT are pressed, the value of <i>shift</i> is 6.

### Remarks

For both events, the object with the focus receives all keystrokes. A form can have the focus only if it has no visible and enabled controls. Although the KeyDown and KeyUp events can apply to most keys, they're most often used for:

- Extended character keys such as function keys.
- Navigation keys.
- Combinations of keys with standard keyboard modifiers.
- Distinguishing between the numeric keypad and regular number keys.

Use KeyDown and KeyUp event procedures if you need to respond to both the pressing and releasing of a key.

KeyDown and KeyUp aren't invoked for:

- The ENTER key if the form has a **CommandButton** control with the **Default** property set to **True**.
- The ESC key if the form has a **CommandButton** control with the **Cancel** property set to **True**.
- The TAB key.

KeyDown and KeyUp interpret the uppercase and lowercase of each character by means of two arguments: *keycode*, which indicates the physical key (thus returning A and a as the same key) and *shift*, which indicates the state of *shift+key* and therefore returns either A or a.

If you need to test for the *shift* argument, you can use the *shift* constants which define the bits within the argument. The constants have the following values:

<b>Constant</b>	<b>Value</b>	<b>Description</b>
<b>vbShiftMask</b>	1	SHIFT key bit mask.
<b>VbCtrlMask</b>	2	CTRL key bit mask.
<b>VbAltMask</b>	4	ALT key bit mask.

The constants act as bit masks that you can use to test for any combination of keys.

You test for a condition by first assigning each result to a temporary integer variable and then comparing *shift* to a bit mask. Use the **And** operator with the *shift* argument to test whether the condition is greater than 0, indicating that the modifier was pressed, as in this example:

```
ShiftDown = (Shift And vbShiftMask) > 0
```

In a procedure, you can test for any combination of conditions, as in this example:

```
If ShiftDown And CtrlDown Then
```

**Note** If the **KeyPreview** property is set to **True**, a form receives these events before controls on the form receive the events. Use the **KeyPreview** property to create global keyboard-handling routines.

## KeyPress Event (ActiveX Controls)

{ewc HLP95EN.DLL,DYNALINK,"See Also":"vbevKeyPressActiveXControlsC;vbproBooksOnlineJumpTopic"} {ewc HLP95EN.DLL,DYNALINK,"Example":"vbevKeyPressActiveXControlsX":1} {ewc HLP95EN.DLL,DYNALINK,"Applies To":"vbevKeyPressActiveXControlsA"} {ewc HLP95EN.DLL,DYNALINK,"Specifics":"vbevKeyPressActiveXControlsS"}

Occurs when the user presses and releases an ANSI key.

### Syntax

**Private Sub Form\_KeyPress(*keyascii* As Integer)**

**Private Sub *object*\_KeyPress(*[index* As Integer,]*keyascii* As Integer)**

The KeyPress event syntax has these parts:

<b>Part</b>	<b>Description</b>
<i>object</i>	An <u>object expression</u> that evaluates to an object in the Applies To list.
<i>index</i>	An integer that uniquely identifies a control if it's in a <u>control array</u> .
<i>keyascii</i>	An integer that returns a standard numeric ANSI keycode. <i>Keyascii</i> is passed by reference; changing it sends a different character to the object. Changing <i>keyascii</i> to 0 cancels the keystroke so the object receives no character.

### Remarks

The object with the focus receives the event. A form can receive the event only if it has no visible and enabled controls or if the **KeyPreview** property is set to **True**. A KeyPress event can involve any printable keyboard character, the CTRL key combined with a character from the standard alphabet or one of a few special characters, and the ENTER or BACKSPACE key. A KeyPress event procedure is useful for intercepting keystrokes entered in a **TextBox** or **ComboBox** control. It enables you to immediately test keystrokes for validity or to format characters as they're typed. Changing the value of the *keyascii* argument changes the character displayed.

You can convert the *keyascii* argument into a character by using the expression:

```
Chr(KeyAscii)
```

You can then perform string operations and translate the character back to an ANSI number that the control can interpret by using the expression:

```
KeyAscii = Asc(char)
```

Use **KeyDown** and **KeyUp** event procedures to handle any keystroke not recognized by **KeyPress**, such as function keys, editing keys, navigation keys, and any combinations of these with keyboard modifiers. Unlike the **KeyDown** and **KeyUp** events, **KeyPress** doesn't indicate the physical state of the keyboard; instead, it passes a character.

**KeyPress** interprets the uppercase and lowercase of each character as separate key codes and, therefore, as two separate characters. **KeyDown** and **KeyUp** interpret the uppercase and lowercase of each character by means of two arguments: *keycode*, which indicates the physical key (thus returning A and a as the same key), and *shift*, which indicates the state of *shift+key* and therefore returns either A or a.

If the **KeyPreview** property is set to **True**, a form receives the event before controls on the form receive the event. Use the **KeyPreview** property to create global keyboard-handling routines.

**Note** The ANSI number for the keyboard combination of CTRL+@ is 0. Because Visual Basic recognizes a *keyascii* value of 0 as a zero-length string (""), avoid using CTRL+@ in your applications.

## MouseDown, MouseUp Events (ActiveX Controls)

```
{ewc HLP95EN.DLL,DYNALINK,"See Also":"vbevtMouseDownActiveXControlsC;vbproBooksOnlineJumpTopic"} {ewc  
HLP95EN.DLL,DYNALINK,"Example":"vbevtMouseDownActiveXControlsX":1} {ewc  
HLP95EN.DLL,DYNALINK,"Applies To":"vbevtMouseDownActiveXControlsA"} {ewc  
HLP95EN.DLL,DYNALINK,"Specifics":"vbevtMouseDownActiveXControlsS"}
```

Occur when the user presses (MouseDown) or releases (MouseUp) a mouse button.

### Syntax

**Private Sub Form\_MouseDown(*button As Integer, shift As Integer, x As Single, y As Single*)**

**Private Sub MDIForm\_MouseDown(*button As Integer, shift As Integer, x As Single, y As Single*)**

**Private Sub *object*\_MouseDown(*[index As Integer,]button As Integer, shift As Integer, x As Single, y As Single*)**

**Private Sub Form\_MouseUp(*button As Integer, shift As Integer, x As Single, y As Single*)**

**Private Sub MDIForm\_MouseUp(*button As Integer, shift As Integer, x As Single, y As Single*)**

**Private Sub *object*\_MouseUp(*[index As Integer,]button As Integer, shift As Integer, x As Single, y As Single*)**

The MouseDown and MouseUp event syntaxes have these parts:

<b>Part</b>	<b>Description</b>
<i>object</i>	Returns an <u>object expression</u> that evaluates to an object in the Applies To list.
<i>index</i>	Returns an integer that uniquely identifies a control if it's in a <u>control array</u> .
<i>button</i>	Returns an integer that identifies the button that was pressed (MouseDown) or released (MouseUp) to cause the event. The <i>button</i> argument is a bit field with bits corresponding to the left button (bit 0), right button (bit 1), and middle button (bit 2). These bits correspond to the values 1, 2, and 4, respectively. Only one of the bits is set, indicating the button that caused the event.
<i>shift</i>	Returns an integer that corresponds to the state of the SHIFT, CTRL, and ALT keys when the button specified in the <i>button</i> argument is pressed or released. A bit is set if the key is down. The <i>shift</i> argument is a bit field with the least-significant bits corresponding to the SHIFT key (bit 0), the CTRL key (bit 1), and the ALT key (bit 2). These bits correspond to the values 1, 2, and 4, respectively. The <i>shift</i> argument indicates the state of these keys. Some, all, or none of the bits can be set, indicating that some, all, or none of the keys are pressed. For example, if both CTRL and ALT were pressed, the value of <i>shift</i> would be 6.
<i>x, y</i>	Returns a number that specifies the current location of the mouse pointer. The <i>x</i> and <i>y</i> values are always expressed in terms of the coordinate system set by the <b>ScaleHeight</b> , <b>ScaleWidth</b> , <b>ScaleLeft</b> , and <b>ScaleTop</b> properties of the object.

### Remarks

Use a MouseDown or MouseUp event procedure to specify actions that will occur when a given mouse button is pressed or released. Unlike the Click and DblClick events, MouseDown and MouseUp events enable you to distinguish between the left, right, and middle mouse buttons. You can also write code for mouse-keyboard combinations that use the SHIFT, CTRL, and ALT keyboard modifiers.

The following applies to both Click and DbClick events:

- If a mouse button is pressed while the pointer is over a form or control, that object "captures" the mouse and receives all mouse events up to and including the last MouseUp event. This implies that the x, y mouse-pointer coordinates returned by a mouse event may not always be in the internal area of the object that receives them.
- If mouse buttons are pressed in succession, the object that captures the mouse after the first press receives all mouse events until all buttons are released.

If you need to test for the *button* or *shift* arguments, you can use constants listed in the Visual Basic (VB) object library in the Object Browser to define the bits within the argument:

<b>Constant (Button)</b>	<b>Value</b>	<b>Description</b>
<b>vbLeftButton</b>	1	Left button is pressed
<b>vbRightButton</b>	2	Right button is pressed
<b>vbMiddleButton</b>	4	Middle button is pressed

<b>Constant (Shift)</b>	<b>Value</b>	<b>Description</b>
<b>vbShiftMask</b>	1	SHIFT key is pressed.
<b>vbCtrlMask</b>	2	CTRL key is pressed.
<b>vbAltMask</b>	4	ALT key is pressed.

The constants then act as bit masks you can use to test for any combination of buttons without having to figure out the unique bit field value for each combination.

**Note** You can use a MouseMove event procedure to respond to an event caused by moving the mouse. The *button* argument for MouseDown and MouseUp differs from the *button* argument used for MouseMove. For MouseDown and MouseUp, the *button* argument indicates exactly one button per event, whereas for MouseMove, it indicates the current state of all buttons.

## Mouselcon Property (ActiveX Controls)

{ewc HLP95EN.DLL,DYNALINK,"See Also":"vbproBooksOnlineJumpTopic;vbproMouselconActiveXControlsC"} {ewc HLP95EN.DLL,DYNALINK,"Example":"vbproMouselconActiveXControlsX":1} {ewc HLP95EN.DLL,DYNALINK,"Applies To":"vbproMouselconActiveXControlsA"} {ewc HLP95EN.DLL,DYNALINK,"Specifics":"vbproMouselconActiveXControlsS"}

Returns or sets a custom mouse icon.

### Syntax

*object*.Mouselcon = LoadPicture(*pathname*)

*object*.Mouselcon [= *picture*]

The **Mouselcon** property syntax has these parts:

Part	Description
<i>object</i>	An <u>object expression</u> that evaluates to an object in the Applies To list.
<i>pathname</i>	A <u>string expression</u> specifying the path and filename of the file containing the custom icon.
<i>picture</i>	The <b>Picture</b> property of a <b>Form</b> object, <b>PictureBox</b> control, or <b>Image</b> control.

### Remarks

The **Mouselcon** property provides a custom icon that is used when the **MousePointer** property is set to 99.

Although Visual Basic does not create or support color cursor (.cur) files (such as those that ship with Windows NT), you can use the **Mouselcon** property to load either cursor or icon files. Color cursor files such as those shipped with Windows NT 3.51, are displayed in black and white. To display a color cursor, use a color icon file (.ico). The **Mouselcon** property provides your program with easy access to custom cursors of any size, with any desired hot spot location. Visual Basic does not load animated cursor (.ani) files, even though 32-bit versions of Windows support these cursors.

# MouseMove Event (ActiveX Controls)

{ewc HLP95EN.DLL,DYNALINK,"See Also":"vbevtMouseMoveActiveXControlsC;vbproBooksOnlineJumpTopic"} {ewc  
HLP95EN.DLL,DYNALINK,"Example":"vbevtMouseMoveActiveXControlsX":1} {ewc  
HLP95EN.DLL,DYNALINK,"Applies To":"vbevtMouseMoveActiveXControlsA"} {ewc  
HLP95EN.DLL,DYNALINK,"Specifics":"vbevtMouseMoveActiveXControlsS"}

Occurs when the user moves the mouse.

## Syntax

**Private Sub Form\_MouseMove(*button As Integer, shift As Integer, x As Single, y As Single*)**

**Private Sub MDIForm\_MouseMove(*button As Integer, shift As Integer, x As Single, y As Single*)**

**Private Sub *object*\_MouseMove(*[index As Integer,] button As Integer, shift As Integer, x As Single, y As Single*)**

The MouseMove event syntax has these parts:

<b>Part</b>	<b>Description</b>
<i>object</i>	An <u>object expression</u> that evaluates to an object in the Applies To list.
<i>index</i>	An integer that uniquely identifies a control if it's in a <u>control array</u> .
<i>button</i>	An integer that corresponds to the state of the mouse buttons in which a <u>bit</u> is set if the button is down. The <i>button</i> argument is a bit field with bits corresponding to the left button (bit 0), right button (bit 1), and middle button (bit 2). These bits correspond to the values 1, 2, and 4, respectively. It indicates the complete state of the mouse buttons; some, all, or none of these three bits can be set, indicating that some, all, or none of the buttons are pressed.
<i>shift</i>	An integer that corresponds to the state of the SHIFT, CTRL, and ALT keys. A bit is set if the key is down. The <i>shift</i> argument is a bit field with the least-significant bits corresponding to the SHIFT key (bit 0), the CTRL key (bit 1), and the ALT key (bit 2). These bits correspond to the values 1, 2, and 4, respectively. The <i>shift</i> argument indicates the state of these keys. Some, all, or none of the bits can be set, indicating that some, all, or none of the keys are pressed. For example, if both CTRL and ALT were pressed, the value of <i>shift</i> would be 6.
<i>x, y</i>	A number that specifies the current location of the mouse pointer. The <i>x</i> and <i>y</i> values are always expressed in terms of the coordinate system set by the <b>ScaleHeight</b> , <b>ScaleWidth</b> , <b>ScaleLeft</b> , and <b>ScaleTop</b> properties of the object.

## Remarks

The MouseMove event is generated continually as the mouse pointer moves across objects. Unless another object has captured the mouse, an object recognizes a MouseMove event whenever the mouse position is within its borders.

If you need to test for the *button* or *shift* arguments, you can use constants listed in the Visual Basic (VB) object library in the Object Browser to define the bits within the argument:

<b>Constant (Button)</b>	<b>Value</b>	<b>Description</b>
<b>vbLeftButton</b>	1	Left button is pressed.
<b>vbRightButton</b>	2	Right button is pressed.

<b>vbMiddleButton</b>	4	Middle button is pressed.
<b>Constant (Shift)</b>	<b>Value</b>	<b>Description</b>
<b>vbShiftMask</b>	1	SHIFT key is pressed.
<b>vbCtrlMask</b>	2	CTRL key is pressed.
<b>vbAltMask</b>	4	ALT key is pressed.

The constants then act as bit masks you can use to test for any combination of buttons without having to figure out the unique bit field value for each combination.

You test for a condition by first assigning each result to a temporary integer variable and then comparing the *button* or *shift* arguments to a bit mask. Use the **And** operator with each argument to test if the condition is greater than zero, indicating the key or button is pressed, as in this example:

```
LeftDown = (Button And vbLeftButton) > 0
CtrlDown = (Shift And vbCtrlMask) > 0
```

Then, in a procedure, you can test for any combination of conditions, as in this example:

```
If LeftDown And CtrlDown Then
```

**Note** You can use `MouseDown` and `MouseUp` event procedures to respond to events caused by pressing and releasing mouse buttons.

The *button* argument for `MouseMove` differs from the *button* argument for `MouseDown` and `MouseUp`. For `MouseMove`, the *button* argument indicates the current state of all buttons; a single `MouseMove` event can indicate that some, all, or no buttons are pressed. For `MouseDown` and `MouseUp`, the *button* argument indicates exactly one button per event.

Any time you move a window inside a `MouseMove` event, it can cause a cascading event. `MouseMove` events are generated when the window moves underneath the pointer. A `MouseMove` event can be generated even if the mouse is perfectly stationary.

## MousePointer Constants (ActiveX Controls)

{ewc HLP95EN.DLL,DYNALINK,"See

Also": "vbidxMousePointerConstantsWindowsCommonControls;vbproBooksOnlineJumpTopic"}

<b>Constant</b>	<b>Value</b>	<b>Description</b>
<b>ccDefault</b>	0	(Default) Shape determined by the object.
<b>ccArrow</b>	1	Arrow.
<b>ccCross</b>	2	Cross (cross-hair pointer).
<b>ccIbeam</b>	3	I Beam.
<b>ccIcon</b>	4	Icon (small square within a square).
<b>ccSize</b>	5	Size (four-pointed arrow pointing north, south, east, and west).
<b>ccSizeNESW</b>	6	Size NE SW (double arrow pointing northeast and southwest).
<b>ccSizeNS</b>	7	Size N S (double arrow pointing north and south).
<b>ccSizeNWSE</b>	8	Size NW, SE.
<b>ccSizeEW</b>	9	Size E W (double arrow pointing east and west).
<b>ccUpArrow</b>	10	Up Arrow.
<b>ccHourglass</b>	11	Hourglass (wait).
<b>ccNoDrop</b>	12	No Drop.
<b>ccArrowHourglass</b>	13	Arrow and hourglass.
<b>cc ArrowQuestion</b>	14	Arrow and question mark.
<b>ccSizeAll</b>	15	Size all.
<b>ccCustom</b>	99	Custom icon specified by the <b>Mouselcon</b> property.

**Note** The cc prefix refers to the custom controls. Prefixes for the constants change with the specific control or group of controls. However, the description remains the same unless indicated.

## MousePointer Property (ActiveX Controls)

```
{ewc HLP95EN.DLL,DYNALINK,"See Also":"vbproBooksOnlineJumpTopic;vbproMousePointerActiveXControlsC"}  
{ewc HLP95EN.DLL,DYNALINK,"Example":"vbproMousePointerActiveXControlsX":1} {ewc  
HLP95EN.DLL,DYNALINK,"Applies To":"vbproMousePointerActiveXControlsA"} {ewc  
HLP95EN.DLL,DYNALINK,"Specifics":"vbproMousePointerActiveXControlsS"}
```

Returns or sets a value indicating the type of mouse pointer displayed when the mouse is over a particular part of an object at run time.

### Syntax

*object*.**MousePointer** [= *value*]

The **MousePointer** property syntax has these parts:

Part	Description
<i>object</i>	An <u>object expression</u> that evaluates to an object in the Applies To list.
<i>value</i>	An integer specifying the type of mouse pointer displayed, as described in Settings.

### Settings

The settings for *value* are:

Constant	Value	Description
<b>vbDefault</b>	0	(Default) Shape determined by the object.
<b>VbArrow</b>	1	Arrow.
<b>VbCrosshair</b>	2	Cross (crosshair pointer).
<b>Vblbeam</b>	3	I beam.
<b>VblIconPointer</b>	4	Icon (small square within a square).
<b>VbSizePointer</b>	5	Size (four-pointed arrow pointing north, south, east, and west).
<b>VbSizeNESW</b>	6	Size NE SW (double arrow pointing northeast and southwest).
<b>VbSizeNS</b>	7	Size N S (double arrow pointing north and south).
<b>VbSizeNWSE</b>	8	Size NW SE (double arrow pointing northwest and southeast).
<b>VbSizeWE</b>	9	Size W E (double arrow pointing west and east).
<b>VbUpArrow</b>	10	Up Arrow.
<b>VbHourglass</b>	11	Hourglass (wait).
<b>VbNoDrop</b>	12	No Drop.
<b>VbArrowHourglass</b>	13	Arrow and hourglass. (Only available in 32-bit Visual Basic.)
<b>vbArrowQuestion</b>	14	Arrow and question mark. (Only available in 32-bit Visual Basic.)
<b>vbSizeAll</b>	15	Size all. (Only available in 32-bit Visual Basic.)
<b>vbCustom</b>	99	Custom icon specified by the <b>MouseIcon</b> property.

**Remarks**

You can use this property when you want to indicate changes in functionality as the mouse pointer passes over controls on a form or dialog box. The Hourglass setting (11) is useful for indicating that the user should wait for a process or operation to finish.

**Note** If your application calls DoEvents, the **MousePointer** property may temporarily change when over a custom control.

## Key Code Constants (ActiveX Controls)

{ewc HLP95EN.DLL,DYNALINK,"See Also":"vbcstKeyCodeConstantsActiveXControlsC;vbproBooksOnlineJumpTopic"}

### Key Codes

Constant	Value	Description
<b>vbKeyLButton</b>	&H1	Left mouse button
<b>vbKeyRButton</b>	&H2	Right mouse button
<b>vbKeyCancel</b>	&H3	CANCEL key
<b>vbKeyMButton</b>	&H4	Middle mouse button
<b>vbKeyBack</b>	&H8	BACKSPACE key
<b>vbKeyTab</b>	&H9	TAB key
<b>vbKeyClear</b>	&HC	CLEAR key
<b>vbKeyReturn</b>	&HD	ENTER key
<b>vbKeyShift</b>	&H10	SHIFT key
<b>vbKeyControl</b>	&H11	CTRL key
<b>vbKeyMenu</b>	&H12	MENU key
<b>vbKeyPause</b>	&H13	PAUSE key
<b>vbKeyCapital</b>	&H14	CAPS LOCK key
<b>vbKeyEscape</b>	&H1B	ESC key
<b>vbKeySpace</b>	&H20	SPACEBAR key
<b>vbKeyPageUp</b>	&H21	PAGE UP key
<b>vbKeyPageDown</b>	&H22	PAGE DOWN key
<b>vbKeyEnd</b>	&H23	END key
<b>vbKeyHome</b>	&H24	HOME key
<b>vbKeyLeft</b>	&H25	LEFT ARROW key
<b>vbKeyUp</b>	&H26	UP ARROW key
<b>vbKeyRight</b>	&H27	RIGHT ARROW key
<b>vbKeyDown</b>	&H28	DOWN ARROW key
<b>vbKeySelect</b>	&H29	SELECT key
<b>vbKeyPrint</b>	&H2A	PRINT SCREEN key
<b>vbKeyExecute</b>	&H2B	EXECUTE key
<b>vbKeySnapshot</b>	&H2C	SNAPSHOT key
<b>vbKeyInsert</b>	&H2D	INS key
<b>vbKeyDelete</b>	&H2E	DEL key
<b>vbKeyHelp</b>	&H2F	HELP key
<b>vbKeyNumlock</b>	&H90	NUM LOCK key

**KeyA Through KeyZ Are the Same as Their ASCII Equivalent: 'A' Through 'Z'**

Constant	Value	Description
<b>vbKeyA</b>	65	A key
<b>vbKeyB</b>	66	B key
<b>vbKeyC</b>	67	C key
<b>vbKeyD</b>	68	D key
<b>vbKeyE</b>	69	E key

<b>vbKeyF</b>	70	F key
<b>vbKeyG</b>	71	G key
<b>vbKeyH</b>	72	H key
<b>vbKeyI</b>	73	I key
<b>vbKeyJ</b>	74	J key
<b>vbKeyK</b>	75	K key
<b>vbKeyL</b>	76	L key
<b>vbKeyM</b>	77	M key
<b>vbKeyN</b>	78	N key
<b>vbKeyO</b>	79	O key
<b>vbKeyP</b>	80	P key
<b>vbKeyQ</b>	81	Q key
<b>vbKeyR</b>	82	R key
<b>vbKeyS</b>	83	S key
<b>vbKeyT</b>	84	T key
<b>vbKeyU</b>	85	U key
<b>vbKeyV</b>	86	V key
<b>vbKeyW</b>	87	W key
<b>vbKeyX</b>	88	X key
<b>vbKeyY</b>	89	Y key
<b>vbKeyZ</b>	90	Z key

**Key0 Through Key9 Are the Same as Their ASCII Equivalents: '0' Through '9'**

<b>Constant</b>	<b>Value</b>	<b>Description</b>
<b>vbKey0</b>	48	0 key
<b>vbKey1</b>	49	1 key
<b>vbKey2</b>	50	2 key
<b>vbKey3</b>	51	3 key
<b>vbKey4</b>	52	4 key
<b>vbKey5</b>	53	5 key
<b>vbKey6</b>	54	6 key
<b>vbKey7</b>	55	7 key
<b>vbKey8</b>	56	8 key
<b>vbKey9</b>	57	9 key

**Keys on the Numeric Keypad**

<b>Constant</b>	<b>Value</b>	<b>Description</b>
<b>vbKeyNumpad0</b>	&H60	0 key
<b>vbKeyNumpad1</b>	&H61	1 key
<b>vbKeyNumpad2</b>	&H62	2 key
<b>vbKeyNumpad3</b>	&H63	3 key
<b>vbKeyNumpad4</b>	&H64	4 key
<b>vbKeyNumpad5</b>	&H65	5 key
<b>vbKeyNumpad6</b>	&H66	6 key
<b>vbKeyNumpad7</b>	&H67	7 key

<b>vbKeyNumpad8</b>	&H68	8 key
<b>vbKeyNumpad9</b>	&H69	9 key
<b>vbKeyMultiply</b>	&H6A	MULTIPLICATION SIGN (*) key
<b>vbKeyAdd</b>	&H6B	PLUS SIGN (+) key
<b>vbKeySeparator</b>	&H6C	ENTER (keypad) key
<b>vbKeySubtract</b>	&H6D	MINUS SIGN (-) key
<b>vbKeyDecimal</b>	&H6E	DECIMAL POINT(.) key
<b>vbKeyDivide</b>	&H6F	DIVISION SIGN (/) key

### Function Keys

<b>Constant</b>	<b>Value</b>	<b>Description</b>
<b>vbKeyF1</b>	&H70	F1 key
<b>vbKeyF2</b>	&H71	F2 key
<b>vbKeyF3</b>	&H72	F3 key
<b>vbKeyF4</b>	&H73	F4 key
<b>vbKeyF5</b>	&H74	F5 key
<b>vbKeyF6</b>	&H75	F6 key
<b>vbKeyF7</b>	&H76	F7 key
<b>vbKeyF8</b>	&H77	F8 key
<b>vbKeyF9</b>	&H78	F9 key
<b>vbKeyF10</b>	&H79	F10 key
<b>vbKeyF11</b>	&H7A	F11 key
<b>vbKeyF12</b>	&H7B	F12 key
<b>vbKeyF13</b>	&H7C	F13 key
<b>vbKeyF14</b>	&H7D	F14 key
<b>vbKeyF15</b>	&H7E	F15 key
<b>vbKeyF16</b>	&H7F	F16 key

## Max, Min Properties (ActiveX Controls)

```
{ewc HLP95EN.DLL,DYNALINK,"See Also":"vbproBooksOnlineJumpTopic;vbproMaxMinPropertiesActiveXControlsC"}  
{ewc HLP95EN.DLL,DYNALINK,"Example":"vbproMaxMinPropertiesActiveXControlsX":1} {ewc  
HLP95EN.DLL,DYNALINK,"Applies To":"vbproMaxMinPropertiesActiveXControlsA"} {ewc  
HLP95EN.DLL,DYNALINK,"Specifics":"vbproMaxMinPropertiesActiveXControlsS"}
```

- **Max** — returns or sets a scroll bar position's maximum **Value** property setting when the scroll box is in its bottom or rightmost position. For the **ProgressBar** control, it returns or sets its maximum value.
- **Min** — returns or sets a scroll bar position's minimum **Value** property setting when the scroll box is in its top or leftmost position. For the **ProgressBar** control, it returns or sets its minimum value.

### Syntax

*object*.**Max** [= *value*]

*object*.**Min** [= *value*]

The **Max** and **Min** property syntaxes have these parts:

Part	Description
<i>object</i>	An <u>object expression</u> that evaluates to an object in the <b>Applies To</b> list.
<i>value</i>	A <u>numeric expression</u> specifying the maximum or minimum <b>Value</b> property setting, as described in <b>Settings</b> .

### Settings

For each property, you can specify an integer between -32,768 and 32,767, inclusive. The default settings are:

- **Max** — 32,767.
- **Min** — 0.

### Remarks

The Microsoft Windows operating environment automatically sets ranges for scroll bars proportional to the contents of forms, **ComboBox** controls, and **ListBox** controls. For a scroll bar (**HScrollBar** or **VScrollBar**) control, however, you must specify these ranges. Use **Max** and **Min** to set a range appropriate to how the scroll bar control is used — for example, as an input device or as an indicator of speed or quantity.

Typically, you set **Max** and **Min** at design time. You can also set them in code at run time if the scrolling range must change dynamically — for example, when adding records to a database that can be scrolled through. You set the maximum and minimum scrolling increments for a scroll bar control with the **LargeChange** and **SmallChange** properties.

**Note** If **Max** is set to less than **Min**, the maximum value is set at the leftmost or topmost position of a horizontal or vertical scroll bar, respectively. The **Max** property of a **ProgressBar** control must always be greater than its **Min** property, and its **Min** property must always be greater than or equal to 0.

The **Max** and **Min** properties define the range of the control. The **ProgressBar** control's **Min** property is 0 and its **Max** property is 100 by default, representing the percentage duration of the operation.

## OLECompleteDrag Event (ActiveX Controls)

```
{ewc HLP95EN.DLL,DYNALINK,"See Also":"vbevOLECompleteDragEventActiveXControlsC;vbproBooksOnlineJumpTopic"}
{ewc HLP95EN.DLL,DYNALINK,"Example":"vbevOLECompleteDragEventActiveXControlsX":1} {ewc
HLP95EN.DLL,DYNALINK,"Applies To":"vbevOLECompleteDragEventActiveXControlsA"} {ewc
HLP95EN.DLL,DYNALINK,"Specifics":"vbevOLECompleteDragEventActiveXControlsS"}
```

Occurs when a source component is dropped onto a target component, informing the source component that a drag action was either performed or canceled.

### Syntax

**Private Sub** *object*\_**CompleteDrag**([*effect* As Long])

The CompleteDrag event syntax has these parts:

Part	Description
<i>object</i>	An <u>object expression</u> that evaluates to an object in the Applies To list.
<i>effect</i>	A long integer set by the source object identifying the action that has been performed, thus allowing the source to take appropriate action if the component was moved (such as the source deleting data if it is moved from one component to another). The possible values are listed in Settings.

### Settings

The settings for *effect* are:

Constant	Value	Description
<b>vbDropEffectNone</b>	0	Drop target cannot accept the data, or the drop operation was cancelled.
<b>vbDropEffectCopy</b>	1	Drop results in a copy of data from the source to the target. The original data is unaltered by the drag operation.
<b>vbDropEffectMove</b>	2	Drop results in a link to the original data being created between drag source and drop target.

### Remarks

The OLECompleteDrag event is the final event to be called in an OLE drag/drop operation. This event informs the source component of the action that was performed when the object was dropped onto the target component. The target sets this value through the *effect* parameter of the OLEDragDrop event. Based on this, the source can then determine the appropriate action it needs to take. For example, if the object was moved into the target (**vbDropEffectMove**), the source needs to delete the object from itself after the move.

If **OLEDragMode** is set to **Automatic**, then Visual Basic handles the default behavior. The event still occurs, however, allowing the user to add to or change the behavior.

Most components support manual OLE drag and drop events, and some support automatic OLE drag and drop events.

## OLEDrag Method (ActiveX Controls)

```
{ewc HLP95EN.DLL,DYNALINK,"See Also":"vbmthOLEDragMethodActiveXControlsC;vbproBooksOnlineJumpTopic"}  
{ewc HLP95EN.DLL,DYNALINK,"Example":"vbmthOLEDragMethodActiveXControlsX":1} {ewc  
HLP95EN.DLL,DYNALINK,"Applies To":"vbmthOLEDragMethodActiveXControlsA"} {ewc  
HLP95EN.DLL,DYNALINK,"Specifics":"vbmthOLEDragMethodActiveXControlsS"}
```

Causes a component to initiate an OLE drag/drop operation.

### Syntax

*object*.**OLEDrag**

The *object* placeholder represents an object expression that evaluates to an object in the Applies To list.

### Remarks

When the **OLEDrag** method is called, the component's OLEStartDrag event occurs, allowing it to supply data to a target component.

## Text Property (ActiveX Controls) Example

This example populates a **TreeView** control with the titles of files in a **ListBox** control. When an item in the **TreeView** control is clicked, the **Text** property is displayed in a **Label** on the form. To try the example, place **TreeView**, **Label**, and **ListBox** controls on a form and paste the code into the form's Declarations section. Run the example and click on any item to see its **Text** property.

```
Private Sub Form_Load()  
    Dim nodX As Node    ' Declare an object variable for the Node.  
    Dim i As Integer    ' Declare a variable for use as a counter.  
  
    ' Add one Node to the TreeView control, and call it the first node  
    Set nodX = TreeView1.Nodes.Add()  
    nodX.Text = "First Node"  
  
    'Populate the ListBox  
    List1.AddItem "Node1"    ' Add each item to list.  
    List1.AddItem "Node2"  
    List1.AddItem "Node3"  
    List1.AddItem "Node4"  
    List1.AddItem "Node5"  
    List1.AddItem "Node6"  
    List1.AddItem "Node7"  
  
    ' Add child nodes to the first Node object. Use the  
    ' ListBox to populate the control.  
    For i = 0 To List1.ListCount - 1  
        Set nodX = TreeView1.Nodes.Add(1, tvwChild)  
        nodX.Text = List1.List(i)  
    Next i  
    Treeview1.Nodes(1).Selected = True  
    nodX.EnsureVisible    ' Make sure the node is visible.  
End Sub  
  
Private Sub TreeView1_NodeClick(ByVal Node As Node)  
    ' Display the clicked Node object's Text property.  
    Label1.Caption = Node.Text  
End Sub
```

# OLEDragDrop Event (ActiveX Controls)

```
{ewc HLP95EN.DLL,DYNALINK,"See Also":"vbevtOLEDragDropEventActiveXControlsC;vbproBooksOnlineJumpTopic"}  
{ewc HLP95EN.DLL,DYNALINK,"Example":"vbevtOLEDragDropEventActiveXControlsX":1} {ewc  
HLP95EN.DLL,DYNALINK,"Applies To":"vbevtOLEDragDropEventActiveXControlsA"} {ewc  
HLP95EN.DLL,DYNALINK,"Specifics":"vbevtOLEDragDropEventActiveXControlsS"}
```

Occurs when a source component is dropped onto a target component when the source component determines that a drop can occur.

**Note** This event occurs only if **OLEDropMode** is set to **1 (Manual)**.

## Syntax

**Private Sub** *object*\_**OLEDragDrop**(*data* As **DataObject**, *effect* As **Long**, *button* As **Integer**, *shift* As **Integer**, *x* As **Single**, *y* As **Single**)

The OLEDragDrop event syntax has these parts:

Part	Description
<i>object</i>	An <u>object expression</u> that evaluates to an object in the Applies To list.
<i>data</i>	A <b>DataObject</b> object containing formats that the source will provide and, in addition, possibly the data for those formats. If no data is contained in the <b>DataObject</b> , it is provided when the control calls the <b>GetData</b> method. The <b>SetData</b> and <b>Clear</b> methods cannot be used here.
<i>effect</i>	A long integer set by the target component identifying the action that has been performed (if any), thus allowing the source to take appropriate action if the component was moved (such as the source deleting the data). The possible values are listed in Settings.
<i>button</i>	An integer which acts as a bit field corresponding to the state of a mouse button when it is depressed. The left button is bit 0, the right button is bit 1, and the middle button is bit 2. These bits correspond to the values 1, 2, and 4, respectively. It indicates the state of the mouse buttons; some, all, or none of these three bits can be set, indicating that some, all, or none of the buttons are depressed.
<i>shift</i>	An integer which acts as a bit field corresponding to the state of the SHIFT, CTRL, and ALT keys when they are depressed. The SHIFT key is bit 0, the CTRL key is bit 1, and the ALT key is bit 2. These bits correspond to the values 1, 2, and 4, respectively. The <i>shift</i> parameter indicates the state of these keys; some, all, or none of the bits can be set, indicating that some, all, or none of the keys are depressed. For example, if both the CTRL and ALT keys were depressed, the value of <i>shift</i> would be 6.
<i>x,y</i>	A number which specifies the current location of the mouse pointer. The <i>x</i> and <i>y</i> values are always expressed in terms of the coordinate system set by the <b>ScaleHeight</b> , <b>ScaleWidth</b> , <b>ScaleLeft</b> , and <b>ScaleTop</b> properties of the object.

## Settings

The settings for *effect* are:

Constant	Value	Description
<b>vbDropEffectNone</b>	0	Drop target cannot accept the data.

<b>vbDropEffectCopy</b>	1	Drop results in a copy of data from the source to the target. The original data is unaltered by the drag operation.
<b>vbDropEffectMove</b>	2	Drop results in data being moved from drag source to drop source. The drag source should remove the data from itself after the move.

### Remarks

The source ActiveX component should always mask values from the *effect* parameter to ensure compatibility with future implementations of ActiveX components. Presently, only three of the 32 bits in the *effect* parameter are used. In future versions of Visual Basic, however, these other bits may be used. Therefore, as a precaution against future problems, drag sources and drop targets should mask these values appropriately before performing any comparisons.

For example, a source component should not compare an *effect* against, say, **vbDropEffectCopy**, such as in this manner:

```
If Effect = vbDropEffectCopy...
```

Instead, the source component should mask for the value or values being sought, such as this:

```
If Effect And vbDropEffectCopy = vbDropEffectCopy...
```

-Or-

```
If (Effect And vbDropEffectCopy)...
```

This allows for the definition of new drop effects in future versions of Visual Basic while preserving backwards compatibility with your existing code.

Most components support manual OLE drag and drop events, and some support automatic OLE drag and drop events.

# OLEDragMode Property (ActiveX Controls)

```
{ewc HLP95EN.DLL,DYNALINK,"See Also":vbproBooksOnlineJumpTopic;vbproOLEDragModePropertyActiveXControlsC"}  
{ewc HLP95EN.DLL,DYNALINK,"Example":vbproOLEDragModePropertyActiveXControlsX":1} {ewc  
HLP95EN.DLL,DYNALINK,"Applies To":vbproOLEDragModePropertyActiveXControlsA"} {ewc  
HLP95EN.DLL,DYNALINK,"Specifics":vbproOLEDragModePropertyActiveXControlsS"} {ewc
```

Returns or sets whether the component or the programmer handles an OLE drag/drop operation.

## Syntax

*object*.OLEDragMode = *mode*

The **OLEDragMode** property syntax has these parts:

Part	Description
<i>object</i>	An <u>object expression</u> that evaluates to an object in the Applies To list.
<i>mode</i>	An integer which specifies the method with which an component handles OLE drag/drop operations, as described in Settings.

## Settings

The settings for *mode* are:

Constant	Value	Description
<b>vbOLEDragManual</b>	0	(Default) Manual. The programmer handles all OLE drag/drop operations.
<b>vbOLEDragAutomatic</b>	1	Automatic. The component handles all OLE drag/drop operations.

## Remarks

When **OLEDragMode** is set to **Manual**, you must call the **OLEDrag** method to start dragging, which then triggers the **OLEStartDrag** event.

When **OLEDragMode** is set to **Automatic**, the source component fills the **DataObject** object with the data it contains and sets the *effects* parameter before initiating the **OLEStartDrag** event (as well as the **OLESetData** and other source-level OLE drag/drop events) when the user attempts to drag out of the control. This gives you control over the drag/drop operation and allows you to intercede by adding other formats, or by overriding or disabling the automatic data and formats using the **Clear** or **SetData** methods.

If the source's **OLEDragMode** property is set to **Automatic**, and no data is loaded in the **OLEStartDrag** event, or *aftereffects* is set to **0**, then the OLE drag/drop operation does not occur.

**Note** If the **DragMode** property of a control is set to **Automatic**, the setting of **OLEDragMode** is ignored, because regular Visual Basic drag and drop events take precedence.

# OLEDragOver Event (ActiveX Controls)

```
{ewc HLP95EN.DLL,DYNALINK,"See Also":"vbevtOLEDragOverEventActiveXControlsC;vbproBooksOnlineJumpTopic"}  
{ewc HLP95EN.DLL,DYNALINK,"Example":"vbevtOLEDragOverEventActiveXControlsX":1} {ewc  
HLP95EN.DLL,DYNALINK,"Applies To":"vbevtOLEDragOverEventActiveXControlsA"} {ewc  
HLP95EN.DLL,DYNALINK,"Specifics":"vbevtOLEDragOverEventActiveXControlsS"}
```

Occurs when one component is dragged over another.

## Syntax

**Private Sub *object*\_OLEDragOver(*data* As **DataObject**, *effect* As **Long**, *button* As **Integer**, *shift* As **Integer**, *x* As **Single**, *y* As **Single**, *state* As **Integer**)**

The OLEDragOver event syntax has these parts:

Part	Description
<i>object</i>	An <u>object expression</u> that evaluates to an object in the Applies To list.
<i>data</i>	A <b>DataObject</b> object containing formats that the source will provide and, in addition, possibly the data for those formats. If no data is contained in the <b>DataObject</b> , it is provided when the control calls the <b>GetData</b> method. The <b>SetData</b> and <b>Clear</b> methods cannot be used here.
<i>effect</i>	A long integer initially set by the source object identifying all effects it supports. This parameter must be correctly set by the target component during this event. The value of <i>effect</i> is determined by logically <b>Or</b> 'ing together all active effects (as listed in Settings). The target component should check these effects and other parameters to determine which actions are appropriate for it, and then set this parameter to one of the allowable effects (as specified by the source) to specify which actions will be performed if the user drops the selection on the component. The possible values are listed in Settings.
<i>button</i>	An integer which acts as a bit field corresponding to the state of a mouse button when it is depressed. The left button is bit 0, the right button is bit 1, and the middle button is bit 2. These bits correspond to the values 1, 2, and 4, respectively. It indicates the state of the mouse buttons; some, all, or none of these three bits can be set, indicating that some, all, or none of the buttons are depressed.
<i>shift</i>	An integer which acts as a bit field corresponding to the state of the SHIFT, CTRL, and ALT keys when they are depressed. The SHIFT key is bit 0, the CTRL key is bit 1, and the ALT key is bit 2. These bits correspond to the values 1, 2, and 4, respectively. The <i>shift</i> parameter indicates the state of these keys; some, all, or none of the bits can be set, indicating that some, all, or none of the keys are depressed. For example, if both the CTRL and ALT keys are depressed, the value of <i>shift</i> would be 6.
<i>x,y</i>	A number that specifies the current horizontal ( <i>x</i> ) and vertical ( <i>y</i> ) position of the mouse pointer within the target form or control. The <i>x</i> and <i>y</i> values are always expressed in terms of the coordinate system set by the <b>ScaleHeight</b> , <b>ScaleWidth</b> , <b>ScaleLeft</b> , and <b>ScaleTop</b> properties of the object.
<i>state</i>	An integer that corresponds to the transition state of the

control being dragged in relation to a target form or control.  
The possible values are listed in Settings.

### Settings

The settings for *effect* are:

<b>Constant</b>	<b>Value</b>	<b>Description</b>
<b>vbDropEffectNone</b>	0	Drop target cannot accept the data.
<b>vbDropEffectCopy</b>	1	Drop results in a copy of data from the source to the target. The original data is unaltered by the drag operation.
<b>vbDropEffectMove</b>	2	Drop results in data being moved from drag source to drop source. The drag source should remove the data from itself after the move.
<b>vbDropEffectScroll</b>	-2147483648 (&H80000000)	Scrolling is occurring or about to occur in the target component. This value is used in conjunction with the other values. <b>Note</b> Use only if you are performing your own scrolling in the target component.

The settings for *state* are:

<b>Constant</b>	<b>Value</b>	<b>Description</b>
<b>vbEnter</b>	0	Source component is being dragged within the range of a target.
<b>vbLeave</b>	1	Source component is being dragged out of the range of a target.
<b>vbOver</b>	2	Source component has moved from one position in the target to another.

### Remarks

**Note** If the *state* parameter is **vbLeave**, indicating that the mouse pointer has left the target, then the *x* and *y* parameters will contain zeros.

The source component should always mask values from the *effect* parameter to ensure compatibility with future implementations of ActiveX components. Presently, only three of the 32 bits in the *effect* parameter are used. In future versions of Visual Basic, however, these other bits may be used. Therefore, as a precaution against future problems, drag sources and drop targets should mask these values appropriately before performing any comparisons.

For example, a source component should not compare an *effect* against, say, **vbDropEffectCopy**, such as in this manner:

```
If Effect = vbDropEffectCopy...
```

Instead, the source component should mask for the value or values being sought, such as this:

```
If Effect And vbDropEffectCopy = vbDropEffectCopy...
```

-or-

If (Effect And vbDropEffectCopy)...

This allows for the definition of new drop effects in future versions of Visual Basic while preserving backwards compatibility with your existing code.

Most components support manual OLE drag and drop events, and some support automatic OLE drag and drop events.

# OLEDropMode Property (ActiveX Controls)

{ewc HLP95EN.DLL,DYNALINK,"See Also":"vbproBooksOnlineJumpTopic;vbproOLEDropModePropertyActiveXControlsC"}  
{ewc HLP95EN.DLL,DYNALINK,"Example":"vbproOLEDropModePropertyActiveXControlsX":1} {ewc  
HLP95EN.DLL,DYNALINK,"Applies To":"vbproOLEDropModePropertyActiveXControlsA"} {ewc  
HLP95EN.DLL,DYNALINK,"Specifics":"vbproOLEDropModePropertyActiveXControlsS"}

Returns or sets how a target component handles drop operations.

## Syntax

*object*.OLEDropMode [= *mode*]

The **OLEDropMode** property syntax has these parts:

Part	Description
<i>object</i>	An <u>object expression</u> that evaluates to an object in the Applies To list.
<i>mode</i>	An enumerated integer which specifies the method which a component handles OLE drag/drop operations, as described in Settings.

## Settings

The settings for *mode* are:

Constant	Value	Description
<b>vbOLEDropNone</b>	0	(Default) None. The target component does not accept OLE drops and displays the No Drop cursor.
<b>vbOLEDropManual</b>	1	Manual. The target component triggers the OLE drop events, allowing the programmer to handle the OLE drop operation in code.
<b>vbOLEDropAutomatic</b>	2	Automatic. The target component automatically accepts OLE drops if the <b>DataObject</b> object contains data in a format it recognizes. No mouse or OLE drag/drop events on the target will occur when <b>OLEDropMode</b> is set to <b>vbOLEDropAutomatic</b> .

## Remarks

**Note** The target component inspects what is being dragged over it in order to determine which events to trigger; the OLE drag/drop events, or the Visual Basic drag/drop events. There is no collision of components or confusion about which events are fired, since only one type of object can be dragged at a time.

## OLEGiveFeedback Event (ActiveX Controls)

```
{ewc HLP95EN.DLL,DYNALINK,"See Also":"vbevtOLEGiveFeedbackEventActiveXControlsC;vbproBooksOnlineJumpTopic"}
{ewc HLP95EN.DLL,DYNALINK,"Example":"vbevtOLEGiveFeedbackEventActiveXControlsX":1} {ewc
HLP95EN.DLL,DYNALINK,"Applies To":"vbevtOLEGiveFeedbackEventActiveXControlsA"} {ewc
HLP95EN.DLL,DYNALINK,"Specifics":"vbevtOLEGiveFeedbackEventActiveXControlsS"}
```

Occurs after every `OLEDragOver` event. `OLEGiveFeedback` allows the source component to provide visual feedback to the user, such as changing the mouse cursor to indicate what will happen if the user drops the object, or provide visual feedback on the selection (in the source component) to indicate what will happen.

### Syntax

**Private Sub** *object*\_**OLEGiveFeedback**(*effect* **As Long**, *defaultcursors* **As Boolean**)

The `OLEGiveFeedback` event syntax has these parts:

Part	Description
<i>object</i>	An <u>object expression</u> that evaluates to an object in the Applies To list.
<i>effect</i>	A long integer set by the target component in the <code>OLEDragOver</code> event specifying the action to be performed if the user drops the selection on it. This allows the source to take the appropriate action (such as giving visual feedback). The possible values are listed in Settings.
<i>defaultcursors</i>	A boolean value which determines whether Visual Basic uses the default mouse cursor proved by the component, or uses a user-defined mouse cursor. <b>True</b> (default) = use default mouse cursor. <b>False</b> = do not use default cursor. Mouse cursor must be set with the <b>MousePointer</b> property of the <b>Screen</b> object.

### Settings

The settings for *effect* are:

Constant	Value	Description
<b>vbDropEffectNone</b>	0	Drop target cannot accept the data.
<b>vbDropEffectCopy</b>	1	Drop results in a copy of data from the source to the target. The original data is unaltered by the drag operation.
<b>vbDropEffectMove</b>	2	Drop results in data being moved from drag source to drop source. The drag source should remove the data from itself after the move.
<b>vbDropEffectScroll</b>	-2147483648 (&H80000000)	Scrolling is occurring or about to occur in the target component. This value is used in conjunction with the other values. <b>Note</b> Use only if you are performing your own scrolling in the target

component.

### Remarks

If there is no code in the `OLEGiveFeedback` event, or if the `defaultcursors` parameter is set to **True**, then Visual Basic automatically sets the mouse cursor to the default cursor provided by the component.

The source component should always mask values from the `effect` parameter to ensure compatibility with future implementations of components. Presently, only three of the 32 bits in the `effect` parameter are used. In future versions of Visual Basic, however, these other bits may be used. Therefore, as a precaution against future problems, drag sources and drop targets should mask these values appropriately before performing any comparisons.

For example, a source component should not compare an `effect` against, say, **vbDropEffectCopy**, such as in this manner:

```
If Effect = vbDropEffectCopy...
```

Instead, the source component should mask for the value or values being sought, such as this:

```
If Effect And vbDropEffectCopy = vbDropEffectCopy...
```

-or-

```
If (Effect And vbDropEffectCopy)...
```

This allows for the definition of new drop effects in future versions of Visual Basic while preserving backwards compatibility with your existing code.

Most components support manual OLE drag and drop events, and some support automatic OLE drag and drop events.

## OLESetData Event (ActiveX Controls)

```
{ewc HLP95EN.DLL,DYNALINK,"See Also":"vbevtOLESetDataEventActiveXControlsC;vbproBooksOnlineJumpTopic"}
{ewc HLP95EN.DLL,DYNALINK,"Example":"vbevtOLESetDataEventActiveXControlsX":1} {ewc
HLP95EN.DLL,DYNALINK,"Applies To":"vbevtOLESetDataEventActiveXControlsA"} {ewc
HLP95EN.DLL,DYNALINK,"Specifics":"vbevtOLESetDataEventActiveXControlsS"}
```

Occurs on an source component when a target component performs the **GetData** method on the source's **DataObject** object, but the data for the specified format has not yet been loaded.

### Syntax

**Private Sub** *object\_OLESetData*(*data As DataObject*, *dataformat As Integer*)

The OLESetData event syntax has these parts:

<b>Part</b>	<b>Description</b>
<i>object</i>	An <u>object expression</u> that evaluates to an object in the Applies To list.
<i>data</i>	A <b>DataObject</b> object in which to place the requested data. The component calls the <b>SetData</b> method to load the requested format.
<i>dataformat</i>	An integer specifying the format of the data that the target component is requesting. The source component uses this value to determine what to load into the <b>DataObject</b> object.

### Remarks

In certain cases, you may wish to defer loading data into the **DataObject** object of a source component to save time, especially if the source component supports many formats. This event allows the source to respond to only one request for a given format of data. When this event is called, the source should check the *format* parameter to determine what needs to be loaded and then perform the **SetData** method on the **DataObject** object to load the data which is then passed back to the target component.

# OLEStartDrag Event (ActiveX Controls)

```
{ewc HLP95EN.DLL,DYNALINK,"See Also":"vbevtOLEStartDragEventActiveXControlsC;vbproBooksOnlineJumpTopic"}  
{ewc HLP95EN.DLL,DYNALINK,"Example":"vbevtOLEStartDragEventActiveXControlsX":1} {ewc  
HLP95EN.DLL,DYNALINK,"Applies To":"vbevtOLEStartDragEventActiveXControlsA"} {ewc  
HLP95EN.DLL,DYNALINK,"Specifics":"vbevtOLEStartDragEventActiveXControlsS"}
```

Occurs when a component's **OLEDrag** method is performed, or when a component initiates an OLE drag/drop operation when the **OLEDragMode** property is set to **Automatic**.

This event specifies the data formats and drop effects that the source component supports. It can also be used to insert data into the **DataObject** object.

## Syntax

**Private Sub** *object\_StartDrag*(*data As DataObject*, *allowedeffects As Long*)

The StartDrag event syntax has these parts:

Part	Description
<i>object</i>	An <u>object expression</u> that evaluates to an object in the Applies To list.
<i>data</i>	A <b>DataObject</b> object containing formats that the source will provide and, optionally, the data for those formats. If no data is contained in the <b>DataObject</b> , it is provided when the control calls the <b>GetData</b> method. The programmer should provide the values for this parameter in this event. The <b>SetData</b> and <b>Clear</b> methods cannot be used here.
<i>allowedeffects</i>	A long integer containing the effects that the source component supports. The possible values are listed in Settings. The programmer should provide the values for this parameter in this event.

## Settings

The settings for *allowedeffects* are:

Constant	Value	Description
<b>vbDropEffectNone</b>	0	Drop target cannot accept the data.
<b>vbDropEffectCopy</b>	1	Drop results in a copy of data from the source to the target. The original data is unaltered by the drag operation.
<b>vbDropEffectMove</b>	2	Drop results in data being moved from drag source to drop source. The drag source should remove the data from itself after the move.

## Remarks

The source component should logically **Or** together the supported values and places the result in the *allowedeffects* parameter. The target component can use this value to determine the appropriate action (and what the appropriate user feedback should be).

The StartDrag event also occurs if the component's **OLEDragMode** property is set to **Automatic**. This allows you to add formats and data to the **DataObject** object after the component has done so. You can also override the default behavior of the component by clearing the **DataObject** object (using the **Clear** method) and then adding your data and formats.

You may wish to defer putting data into the **DataObject** object until the target component requests it.

This allows the source component to save time by not loading multiple data formats. When the target performs the **GetData** method on the **DataObject**, the source's OLESetData event will occur if the requested data is not contained in the **DataObject**. At this point, the data can be loaded into the **DataObject**, which will in turn provide the data to the target.

If the user does not load any formats into the **DataObject**, then the drag/drop operation is canceled.

## SetData Method (ActiveX Controls)

{ewc HLP95EN.DLL,DYNALINK,"See Also":"vbmthSetDataMethodActiveXControlsC;vbproBooksOnlineJumpTopic"}  
{ewc HLP95EN.DLL,DYNALINK,"Example":"vbmthSetDataMethodX":1} {ewc HLP95EN.DLL,DYNALINK,"Applies To":"vbmthSetDataMethodA"} {ewc HLP95EN.DLL,DYNALINK,"Specifics":"vbmthSetDataMethodS"}

Inserts data into a **DataObject** object using the specified data format.

### Syntax

*object*.**SetData** [*data*], [*format*]

The **SetData** method syntax has these parts:

Part	Description
<i>object</i>	Required. An <u>object expression</u> that evaluates to an object in the Applies To list.
<i>data</i>	Optional. A variant containing the data to be passed to the <b>DataObject</b> object.
<i>format</i>	Optional. A constant or value that specifies the format of the data being passed, as described in Settings.

### Settings

The settings for *format* are:

Constant	Value	Description
<b>vbCFText</b>	1	Text (.txt files)
<b>vbCFBitmap</b>	2	<u>Bitmap</u> (.bmp files)
<b>vbCFMetafile</b>	3	<u>Metafile</u> (.wmf files)
<b>vbCFEMetafile</b>	14	Enhanced metafile (.emf files)
<b>vbCFDIB</b>	8	Device-independent bitmap (DIB)
<b>vbCFPalette</b>	9	Color palette
<b>vbCFFiles</b>	15	List of files
<b>vbCFRTF</b>	-16639	Rich text format (.rtf files)

### Remarks

These constants are listed in the Visual Basic (VB) object library in the Object Browser.

The *data* argument is optional. This allows you to set several different formats that the source component can support without having to load the data separately for each format. Multiple formats are set by calling **SetData** several times, each time using a different format. If you wish to start fresh, use the **Clear** method to clear all data and format information from the **DataObject**.

The *format* argument is also optional, but either the *data* or *format* argument must be specified. If *data* is specified, but not *format*, then Visual Basic will try to determine the format of the data. If it is unsuccessful, then an error is generated. When the target requests the data, and a format was specified, but no data was provided, the source's **OLESetData** event occurs, and the source can then provide the requested data type.

It's possible for the **GetData** and **SetData** methods to use data formats other than those listed in Settings, including user-defined formats registered with Windows via the `RegisterClipboardFormat()` API function. However, there are a few caveats:

- The **SetData** method requires the data to be in the form of a byte array when it does not recognize the data format specified.
- The **GetData** method always returns data in a byte array when it is in a format that it doesn't

recognize, although Visual Basic can transparently convert this returned byte array into other data types, such as strings.

- The byte array returned by **GetData** will be larger than the actual data when running on some operating systems, with arbitrary bytes at the end of the array. The reason for this is that Visual Basic does not know the data's format, and knows only the amount of memory that the operating system has allocated for the data. This allocation of memory is often larger than is actually required for the data. Therefore, there may be extraneous bytes near the end of the allocated memory segment. As a result, you must use appropriate functions to interpret the returned data in a meaningful way (such as truncating a string at a particular length with the **Left** function if the data is in a text format).

## Picture Property (ActiveX Controls)

```
{ewc HLP95EN.DLL,DYNALINK,"See Also": "vbproBooksOnlineJumpTopic;vbproPictureActiveXControlsC;vbproPictureC"}
{ewc HLP95EN.DLL,DYNALINK,"Example": "vbproPictureActiveXControlsX":1} {ewc
HLP95EN.DLL,DYNALINK,"Applies To": "vbproPictureActiveXControlsA"} {ewc
HLP95EN.DLL,DYNALINK,"Specifics": "vbproPictureActiveXControlsS"}
```

Returns or sets a graphic to be displayed in a control. For the **OLE** container control, not available at design time and read-only at run time.

### Syntax

*object*.Picture [= *picture*]

The **Picture** property syntax has these parts:

Part	Description
<i>object</i>	An <u>object expression</u> that evaluates to an object in the Applies To list.
<i>picture</i>	A <u>string expression</u> specifying a file containing a graphic, as described in Settings.

### Settings

The settings for *picture* are:

Setting	Description
(None)	(Default) No picture.
(Bitmap, icon, metafile)	Specifies a graphic. You can load the graphic from the <u>Properties window</u> at design time. At run time, you can also set this property using the <b>LoadPicture</b> function on a <u>bitmap</u> , <u>icon</u> , or <u>metafile</u> .

### Remarks

At design time, you can transfer a graphic with the Clipboard using the Copy, Cut, and Paste commands on the Edit menu. At run time, you can use Clipboard methods such as **GetData**, **SetData**, and **GetFormat** with the nontext Clipboard constants **vbCFBitmap**, **vbCFMetafile**, and **vbCFDIB**, which are listed in the Visual Basic (VB) object library in the Object Browser.

When setting the **Picture** property at design time, the graphic is saved and loaded with the form. If you create an executable file, the file contains the image. When you load a graphic at run time, the graphic isn't saved with the application. Use the **SavePicture** statement to save a graphic from a form or picture box into a file.

**Note** At run time, the **Picture** property can be set to any other object's **DragIcon**, **Icon**, **Image**, or **Picture** property, or you can assign it the graphic returned by the **LoadPicture** function. The exception to this is the **Picture** property of the **ListImages** object, which is a read-only property.

## SelLength, SelStart, SelText Properties (ActiveX Controls)

{ewc HLP95EN.DLL,DYNALINK,"See Also":"vbproBooksOnlineJumpTopic;vbproSelLengthC"} {ewc HLP95EN.DLL,DYNALINK,"Example":"vbproSelLengthX":1} {ewc HLP95EN.DLL,DYNALINK,"Applies To":"vbproSelLengthA"} {ewc HLP95EN.DLL,DYNALINK,"Specifics":"vbproSelLengthS"}

- **SelLength** — returns or sets the number of characters selected.
- **SelStart** — returns or sets the starting point of text selected; indicates the position of the insertion point if no text is selected.
- **SelText** — returns or sets the string containing the currently selected text; consists of a zero-length string ("" ) if no characters are selected.

These properties aren't available at design time.

### Syntax

*object.SelLength* [= *number*]

*object.SelStart* [= *index*]

*object.SelText* [= *value*]

The **SelLength**, **SelStart**, and **SelText** property syntaxes have these parts:

Part	Description
<i>object</i>	An <u>object expression</u> that evaluates to an object in the Applies To list.
<i>number</i>	A <u>numeric expression</u> specifying the number of characters selected. For <b>SelLength</b> and <b>SelStart</b> , the valid range of settings is 0 to text length — the total number of characters in the edit area of a <b>ComboBox</b> or <b>TextBox</b> control.
<i>index</i>	A numeric expression specifying the starting point of the selected text, as described in Settings.
<i>value</i>	A <u>string expression</u> containing the selected text.

### Remarks

Use these properties for tasks such as setting the insertion point, establishing an insertion range, selecting substrings in a control, or clearing text. Used in conjunction with the **Clipboard** object, these properties are useful for copy, cut, and paste operations.

When working with these properties:

- Setting **SelLength** less than 0 causes a run-time error.
- Setting **SelStart** greater than the text length sets the property to the existing text length; changing **SelStart** changes the selection to an insertion point and sets **SelLength** to 0.
- Setting **SelText** to a new value sets **SelLength** to 0 and replaces the selected text with the new string.

## ShowTips Property (ActiveX Controls)

{ewc HLP95EN.DLL,DYNALINK,"See Also":"vbproBooksOnlineJumpTopic;vbproTooltipsC"} {ewc  
HLP95EN.DLL,DYNALINK,"Example":"vbproTooltipsX":1} {ewc HLP95EN.DLL,DYNALINK,"Applies  
To":"vbproTooltipsA"} {ewc HLP95EN.DLL,DYNALINK,"Specifics":"vbproTooltipsS"}

Returns a value that determines whether ToolTips are displayed for an object.

### Syntax

*object*.**ShowTips** [= *value*]

The **ShowTips** property syntax has these parts:

<b>Part</b>	<b>Description</b>
<i>object</i>	An <u>object expression</u> that evaluates to an object in the Applies To list.
<i>value</i>	A <u>Boolean expression</u> specifying whether ToolTips are displayed, as described in Settings.

### Settings

The settings for *value* are:

<b>Setting</b>	<b>Description</b>
<b>True</b>	(Default) Each object in the control may display an associated string, which is the setting of the <b>ToolTipText</b> property, in a small rectangle below the object. This ToolTip appears when the user's cursor hovers over the object at run time for about one second.
<b>False</b>	An object will not display a ToolTip at <u>run time</u> .

### Remarks

At design time you can set the **ShowTips** property on the General tab in the control's Property Pages dialog box.

## Text Property (ActiveX Controls)

{ewc HLP95EN.DLL,DYNALINK,"See Also":"vbproBooksOnlineJumpTopic;vbproTextActiveXControlsC"} {ewc HLP95EN.DLL,DYNALINK,"Example":"vbproTextActiveXControlsX":1} {ewc HLP95EN.DLL,DYNALINK,"Applies To":"vbproTextActiveXControlsA"} {ewc HLP95EN.DLL,DYNALINK,"Specifics":"vbproTextActiveXControlsS"}

Returns or sets the text contained in an object.

### Syntax

*object*.Text [= *string*]

The **Text** property syntax has these parts:

<b>Part</b>	<b>Description</b>
<i>object</i>	An <u>object expression</u> that evaluates to an object in the Applies To list.
<i>string</i>	A <u>string expression</u> specifying the text appearing in the object.

## Value Property (ActiveX Controls)

{ewc HLP95EN.DLL,DYNALINK,"See Also":"vbproBooksOnlineJumpTopic;vbproValueActiveXControlsC"} {ewc HLP95EN.DLL,DYNALINK,"Example":"vbproValueActiveXControlsX":1} {ewc HLP95EN.DLL,DYNALINK,"Applies To":"vbproValueActiveXControlsA"} {ewc HLP95EN.DLL,DYNALINK,"Specifics":"vbproValueActiveXControlsS"}

Returns or sets the value of an object.

### Syntax

*object*.**Value** [= *integer*]

The **Value** property syntax has these parts:

<b>Part</b>	<b>Description</b>
<i>object</i>	An <u>object expression</u> that evaluates to an object in the Applies To list.
<i>integer</i>	For a <b>Slider</b> control, a long integer that specifies the current position of the slider. For the <b>ProgressBar</b> control, an integer that specifies the value of the <b>ProgressBar</b> control. For other controls, see Settings below.

### Settings

For the **Button** object, the settings for *integer* are:

<b>Constant</b>	<b>Value</b>	<b>Description</b>
<b>tbrUnPressed</b>	0	(Default). The button is not currently pressed or checked.
<b>tbrPressed</b>	1	The button is currently pressed or checked.

### Remarks

- **Slider** control—returns or sets the current position of the slider. **Value** is always between the values for the **Max** and **Min** properties, inclusive, for a **Slider** control.
- **ProgressBar** control—returns or sets a value indicating an operation's approximate progress toward completion. Incrementing the **Value** property doesn't change the appearance of the **ProgressBar** control by the exact value of the **Value** property. **Value** is always in the range between the values for the **Max** and **Min** properties, inclusive. Not available at design time.

## Value Property (ActiveX Controls) Example

This example uses the **Value** property to determine which icon from an associated **ImageList** control is displayed on the **Toolbar** control. To try the example, place a **Toolbar** control on a form and paste the code into the form's Declarations section. Then run the example.

```
Private Sub Toolbar1_ButtonClick(ByVal Button As Button)
    ' Use the Key value to determine which button has been clicked.
    Select Case Button.Key

        Case "Done" ' A check button.
            If Button.Value = vbUnchecked Then
                ' The button is unchecked.
                Button.Value = vbChecked ' Check the button.
                ' Assuming there is a ListImage object with
                ' key "down."
                Button.Image = "down"
            Else ' Uncheck the button
                Button.Value = vbUnchecked
                ' Assuming there is a ListImage object with
                ' key " up."
                Button.Image = "up"
            End If

            ' More Cases are possible.
        End Select
    End Sub
```

## RemoteHost Property (ActiveX Controls)

{ewc HLP95EN.DLL,DYNALINK,"See Also":"vbproBooksOnlineJumpTopic;vbproInetRemoteHostC"} {ewc HLP95EN.DLL,DYNALINK,"Example":"vbproInetRemoteHostX":1} {ewc HLP95EN.DLL,DYNALINK,"Applies To":"vbproInetRemoteHostA"} {ewc HLP95EN.DLL,DYNALINK,"Specifics":"vbproInetRemoteHostS"}

Returns or sets the remote machine to which a control sends or receives data. You can either provide a host name, for example, "FTP://ftp.microsoft.com," or an IP address string in dotted format, such as "100.0.1.1".

### Syntax

*object.RemoteHost* = *string*

The **RemoteHost** property syntax has these parts:

Part	Description
<i>object</i>	An <u>object expression</u> that evaluates to an object in the Applies To list.
<i>string</i>	The name or address of the remote computer.

### Data Type

String

### Remarks

When this property is specified, the **URL** property is updated to show the new value. Also, if the host portion of the URL is updated, this property is also updated to reflect the new value.

The **RemoteHost** property can also be changed when invoking the **OpenURL** or **Execute** methods.

At run time, changing this value has no effect until the next connection.

## RemotePort Property (ActiveX Controls)

{ewc HLP95EN.DLL,DYNALINK,"See Also":"vbproBooksOnlineJumpTopic;vbproInetRemotePortC"} {ewc HLP95EN.DLL,DYNALINK,"Example":"vbproInetRemotePortX":1} {ewc HLP95EN.DLL,DYNALINK,"Applies To":"vbproInetRemotePortA"} {ewc HLP95EN.DLL,DYNALINK,"Specifics":"vbproInetRemotePortS"}

Returns or sets the remote port number to connect to.

### Syntax

*object*.RemotePort = *port*

The **RemotePort** property syntax has these parts:

Part	Description
<i>object</i>	An <u>object expression</u> that evaluates to an object in the Applies To list.
<i>port</i>	The port to connect to. The default value of this property is 80.

### Data Type

Long

### Remarks

When you set the **Protocol** property, the **RemotePort** property is set automatically to the appropriate default port for each protocol. Default port numbers are shown in the table below:

Port	Description
80	HTTP, commonly used for WorldWideWeb connections.
21	FTP.

## hDC Property (ActiveX Controls)

```
{ewc HLP95EN.DLL,DYNALINK,"See Also":"vbproBooksOnlineJumpTopic;vbproHDCPropertyActiveXControlsC"} {ewc  
HLP95EN.DLL,DYNALINK,"Example":"vbproHDCPropertyActiveXControlsX":1} {ewc  
HLP95EN.DLL,DYNALINK,"Applies To":"vbproHDCPropertyActiveXControlsA"} {ewc  
HLP95EN.DLL,DYNALINK,"Specifics":"vbproHDCPropertyActiveXControlsS"}
```

Returns a handle provided by the Microsoft Windows operating environment to the device context of an object.

### Syntax

*object*.hDC

The *object* placeholder represents an object expression that evaluates to an object in the Applies To list.

### Remarks

This property is a Windows operating environment device context handle. The Windows operating environment manages the system display by assigning a device context for the **Printer** object and for each form and **PictureBox** control in your application. You can use the **hDC** property to refer to the handle for an object's device context. This provides a value to pass to Windows API calls.

With a **CommonDialog** control, this property returns a device context for the printer selected in the Print dialog box when the **cdlReturnDC** flag is set or an information context when the **cdlReturnIC** flag is set.

**Note** The value of the **hDC** property can change while a program is running, so don't store the value in a variable; instead, use the **hDC** property each time you need it.

The **AutoRedraw** property can cause the **hDC** property setting to change. If **AutoRedraw** is set to **True** for a form or **PictureBox** container, **hDC** acts as a handle to the device context of the persistent graphic (equivalent to the **Image** property). When **AutoRedraw** is **False**, **hDC** is the actual **hDC** value of the Form window or the **PictureBox** container. The **hDC** property setting may change while the program is running regardless of the **AutoRedraw** setting.

## Height, Width Properties (ActiveX Controls)

```
{ewc HLP95EN.DLL,DYNALINK,"See Also":"vbproBooksOnlineJumpTopic;vbproHeightWidthPropertiesActiveXControlsC"}
{ewc HLP95EN.DLL,DYNALINK,"Example":"vbproHeightWidthPropertiesActiveXControlsX":1} {ewc
HLP95EN.DLL,DYNALINK,"Applies To":"vbproHeightWidthPropertiesActiveXControlsA"} {ewc
HLP95EN.DLL,DYNALINK,"Specifics":"vbproHeightWidthPropertiesActiveXControlsS"}
```

Return or set the dimensions of an object or the width of the **Columns** object of a **DBGrid** control. For the **Printer** and **Screen** objects, not available at design time.

### Syntax

*object*.**Height** [= *number*]  
*object*.**Width** [= *number*]

The **Height** and **Width** property syntaxes have these parts:

<b>Part</b>	<b>Description</b>
<i>object</i>	An <u>object expression</u> that evaluates to an object in the Applies To list.
<i>number</i>	A <u>numeric expression</u> specifying the dimensions of an object, as described in Settings.

### Settings

Measurements are calculated as follows:

- **Form** — the external height and width of the form, including the borders and title bar.
- **Control** — measured from the center of the control's border so that controls with different border widths align correctly. These properties use the scale units of a control's container.
- **Printer** object — the physical dimensions of the paper set up for the printing device; not available at design time. If set at run time, values in these properties are used instead of the setting of the **PaperSize** property.
- **Screen** object — the height and width of the screen; not available at design time and read-only at run time.
- **Picture** object — the height and width of the picture in HiMetric units.

### Remarks

For **Form**, **Printer**, and **Screen** objects, these properties are always measured in twips. For a form or control, the values for these properties change as the object is sized by the user or by your code. Maximum limits of these properties for all objects are system-dependent.

If you set the **Height** and **Width** properties for a printer driver that doesn't allow these properties to be set, no error occurs and the size of the paper remains as it was. If you set **Height** and **Width** for a printer driver that allows only certain values to be specified, no error occurs and the property is set to whatever the driver allows. For example, you could set **Height** to 150 and the driver would set it to 144.

Use the **Height**, **Width**, **Left**, and **Top** properties for operations or calculations based on an object's total area, such as sizing or moving the object. Use the **ScaleLeft**, **ScaleTop**, **ScaleHeight**, and **ScaleWidth** properties for operations or calculations based on an object's internal area, such as drawing or moving objects within another object.

**Note** The **Height** property can't be changed for the **DriveListBox** control or for the **ComboBox** control, whose **Style** property setting is 0 (Dropdown Combo) or 2 (Dropdown List).

For the **Columns** object of the **DBGrid** control, **Width** is specified in the unit of measure of the object that contains the **DBGrid**. The default value for **Width** is the value of the **DefColWidth** property of **DBGrid**.

For the **Picture** object, use the **ScaleX** and **ScaleY** methods to convert HiMetric units into the scale you need.

## Index Property (ActiveX Controls)

```
{ewc HLP95EN.DLL,DYNALINK,"See Also":"vbproBooksOnlineJumpTopic;vbproIndexPropertyActiveXControlsC"}  
{ewc HLP95EN.DLL,DYNALINK,"Example":"vbproIndexPropertyActiveXControlsX":1} {ewc  
HLP95EN.DLL,DYNALINK,"Applies To":"vbproIndexPropertyActiveXControlsA"} {ewc  
HLP95EN.DLL,DYNALINK,"Specifics":"vbproIndexPropertyActiveXControlsS"}
```

Returns or sets the number that uniquely identifies an object in a collection.

### Syntax

*object*.**Index**

The object placeholder is an object expression that evaluates to an object in the Applies To list.

### Remarks

The **Index** property is set by default to the order of the creation of objects in a collection. The index for the first object in a collection will always be one.

The value of the **Index** property of an object can change when objects in the collection are reordered, such as when you set the **Sorted** property to **True**. If you expect the **Index** property to change dynamically, it may be more useful to refer to objects in a collection by using the **Key** property.

## Left, Top Properties (ActiveX Controls)

```
{ewc HLP95EN.DLL,DYNALINK,"See Also":"vbproBooksOnlineJumpTopic;vbproLeftTopPropertiesActiveXControlsC"}
{ewc HLP95EN.DLL,DYNALINK,"Example":"vbproLeftTopPropertiesActiveXControlsX":1} {ewc
HLP95EN.DLL,DYNALINK,"Applies To":"vbproLeftTopPropertiesActiveXControlsA"} {ewc
HLP95EN.DLL,DYNALINK,"Specifics":"vbproLeftTopPropertiesActiveXControlsS"}
```

- **Left** — returns or sets the distance between the internal left edge of an object and the left edge of its container.
- **Top** — returns or sets the distance between the internal top edge of an object and the top edge of its container.
- For the **Panel** object only, this is a read-only property.

### Syntax

*object*.**Left** [= *value*]

*object*.**Top** [= *value*]

The **Left** and **Top** property syntaxes have these parts:

<b>Part</b>	<b>Description</b>
<i>object</i>	An <u>object expression</u> that evaluates to an object in the Applies To list.
<i>value</i>	A <u>numeric expression</u> specifying distance.

### Remarks

For a form, the **Left** and **Top** properties are always expressed in twips; for a control, they are measured in units depending on the coordinate system of its container. The values for these properties change as the object is moved by the user or by code. For the **CommonDialog** and **Timer** controls, these properties aren't available at run time.

For either property, you can specify a single-precision number.

Use the **Left**, **Top**, **Height**, and **Width** properties for operations based on an object's external dimensions, such as moving or resizing. Use the **ScaleLeft**, **ScaleTop**, **ScaleHeight**, and **ScaleWidth** properties for operations based on an object's internal dimensions, such as drawing or moving objects that are contained within the object. The scale-related properties apply only to **PictureBox** controls and **Form** and **Printer** objects.

## Remove Method (ActiveX Controls)

```
{ewc HLP95EN.DLL,DYNALINK,"See Also":"vbmthRemoveMethodActiveXControlsC;vbproBooksOnlineJumpTopic"}
{ewc HLP95EN.DLL,DYNALINK,"Example":"vbmthRemoveMethodActiveXControlsX":1} {ewc
HLP95EN.DLL,DYNALINK,"Applies To":"vbmthRemoveMethodActiveXControlsA"} {ewc
HLP95EN.DLL,DYNALINK,"Specifics":"vbmthRemoveMethodActiveXControlsS"}
```

Removes a specific member from a collection.

### Syntax

*object.Remove index*

The **Remove** method syntax has these parts:

<b>Part</b>	<b>Description</b>
<i>object</i>	An <u>object expression</u> that evaluates to an object in the Applies To list.
<i>index</i>	An integer or string that uniquely identifies the object within the collection. Use an integer to specify the value of the <b>Index</b> property; use a string to specify the value of the <b>Key</b> property.

### Remarks

To remove all the members of a collection, use the **Clear** method.

## Tag Property (ActiveX Controls)

```
{ewc HLP95EN.DLL,DYNALINK,"See Also":"vbproBooksOnlineJumpTopic;vbproTagPropertyActiveXControlsC"} {ewc  
HLP95EN.DLL,DYNALINK,"Example":"vbproTagPropertyActiveXControlsX":1} {ewc  
HLP95EN.DLL,DYNALINK,"Applies To":"vbproTagPropertyActiveXControlsA"} {ewc  
HLP95EN.DLL,DYNALINK,"Specifics":"vbproTagPropertyActiveXControlsS"}
```

Returns or sets an expression that stores any extra data needed for your program. Unlike other properties, the value of the **Tag** property isn't used by Visual Basic; you can use this property to identify objects.

### Syntax

*object.Tag* [= *expression*]

The **Tag** property syntax has these parts:

<b>Part</b>	<b>Description</b>
<i>object</i>	An <u>object expression</u> that evaluates to an object in the Applies To list.
<i>expression</i>	A <u>string expression</u> identifying the object. The default is a zero-length string ("").

### Remarks

You can use this property to assign an identification string to an object without affecting any of its other property settings or causing side effects. The **Tag** property is useful when you need to check the identity of a control or **MDIForm** object that is passed as a variable to a procedure.

**Tip** When you create a new instance of a form, assign a unique value to the **Tag** property.

**Note** The **Tag** property is of type Variant for ActiveX control collections such as **ToolBar Button** objects, **TreeView Node** objects, **Listview ListItem** and **ColumnHeader** objects, **ImageList ListImage** objects, **TabStrip Tab** objects, and **StatusBar Panel** objects. This is a powerful language feature that enables you to pass, for example, objects (such as a selected **Node**) as a **Tag**.

## Visible Property (ActiveX Controls)

```
{ewc HLP95EN.DLL,DYNALINK,"See Also":"vbproBooksOnlineJumpTopic;vbproVisiblePropertyActiveXControlsC"}
{ewc HLP95EN.DLL,DYNALINK,"Example":"vbproVisiblePropertyActiveXControlsX":1} {ewc
HLP95EN.DLL,DYNALINK,"Applies To":"vbproVisiblePropertyActiveXControlsA"} {ewc
HLP95EN.DLL,DYNALINK,"Specifics":"vbproVisiblePropertyActiveXControlsS"}
```

Returns or sets a value indicating whether an object is visible or hidden.

### Syntax

*object.Visible* [= *boolean*]

The **Visible** property syntax has these parts:

<b>Part</b>	<b>Description</b>
<i>object</i>	An <u>object expression</u> that evaluates to an object in the Applies To list.
<i>boolean</i>	A <u>Boolean expression</u> specifying whether the object is visible or hidden.

### Settings

The settings for *boolean* are:

<b>Setting</b>	<b>Description</b>
<b>True</b>	(Default) Object is visible.
<b>False</b>	Object is hidden.

### Remarks

To hide an object at startup, set the **Visible** property to **False** at design time. Setting this property in code enables you to hide and later redisplay a control at run time in response to a particular event.

**Note** Using the **Show** or **Hide** method on a form is the same as setting the form's **Visible** property in code to **True** or **False**, respectively.

## Object Property (ActiveX Controls)

```
{ewc HLP95EN.DLL,DYNALINK,"See Also": "vbproBooksOnlineJumpTopic;vbproObjectPropertyActiveXControlsC"}  
{ewc HLP95EN.DLL,DYNALINK,"Example": "vbproObjectPropertyActiveXControlsX":1} {ewc  
HLP95EN.DLL,DYNALINK,"Applies To": "vbproObjectPropertyActiveXControlsA"} {ewc  
HLP95EN.DLL,DYNALINK,"Specifics": "vbproObjectPropertyActiveXControlsS"}
```

Returns the object and/or a setting of an object's method or property.

### Syntax

*object*.**Object**[*.property* | *.method*]

The **Object** property syntax has these parts:

Part	Description
<i>object</i>	An <u>object expression</u> that evaluates to an object in the <u>Applies To</u> list.
<i>property</i>	Property that the object supports.
<i>method</i>	Method that the object supports.

### Remarks

Use this property to specify an object you want to use in an Automation task.

You use the object returned by the **Object** property in an Automation task by using the properties and methods of that object. For information on which properties and methods an object supports, see the documentation for the application that created the object.

## Property Pages (ActiveX Controls)

{ewc HLP95EN.DLL,DYNALINK,"See Also":"vbproBooksOnlineJumpTopic;vbproPropertyPagesActiveXControlsC"}  
{ewc HLP95EN.DLL,DYNALINK,"Example":"vbproPropertyPagesActiveXControlsX":1} {ewc  
HLP95EN.DLL,DYNALINK,"Applies To":"vbproPropertyPagesActiveXControlsA"} {ewc  
HLP95EN.DLL,DYNALINK,"Specifics":"vbproPropertyPagesActiveXControlsS"}

To get Help for the properties contained in a control's **Property Page** dialog box, click the button below corresponding to the control in which you are interested. Then click the property name to get Help for that property.

## RightToLeft Property (ActiveX Controls)

```
{ewc HLP95EN.DLL,DYNALINK,"See Also":"vbproBooksOnlineJumpTopic;vbproRightToLeftPropertyActiveXControlsC"}  
{ewc HLP95EN.DLL,DYNALINK,"Example":"vbproRightToLeftPropertyActiveXControlsX":1} {ewc  
HLP95EN.DLL,DYNALINK,"Applies To":"vbproRightToLeftPropertyActiveXControlsA"} {ewc  
HLP95EN.DLL,DYNALINK,"Specifics":"vbproRightToLeftPropertyActiveXControlsS"}
```

Returns a boolean value that indicates the text display direction and controls the visual appearance on a bidirectional system.

### Syntax

*object*.**RightToLeft**

The **RightToLeft** property syntax has this part:

<b>Part</b>	<b>Description</b>
<i>object</i>	An object expression that evaluates to an object in the Applies To list.

### Settings

The possible boolean return values from the **RightToLeft** property are:

<b>Setting</b>	<b>Description</b>
<b>True</b>	The control is running on a bi-directional platform, such as Arabic Windows95 or Hebrew Windows95, and text is running from right to left. The control should modify its behavior, such as putting vertical scroll bars at the left side of a text or list box, putting labels to the right of text boxes, etc.
<b>False</b>	The control should act as though it was running on a non-bidirectional platform, such as English Windows95, and text is running from left to right. If the container does not implement this ambient property, this will be the default value.

## Refresh Method (ActiveX Controls)

```
{ewc HLP95EN.DLL,DYNALINK,"See Also":"vbmthRefreshMethodActiveXControlsC;vbproBooksOnlineJumpTopic"}
{ewc HLP95EN.DLL,DYNALINK,"Example":"vbmthRefreshMethodActiveXControlsX":1} {ewc
HLP95EN.DLL,DYNALINK,"Applies To":"vbmthRefreshMethodActiveXControlsA"} {ewc
HLP95EN.DLL,DYNALINK,"Specifics":"vbmthRefreshMethodActiveXControlsS"}
```

Forces a complete repaint of a form or control.

### Syntax

*object*.Refresh

The *object* placeholder represents an object expression that evaluates to an object in the Applies To list.

### Remarks

Use the **Refresh** method when you want to:

- Completely display one form while another form loads.
- Update the contents of a file-system list box, such as a **FileListBox** control.
- Update the data structures of a **Data** control.

**Refresh** can't be used on MDI forms, but can be used on MDI child forms. You can't use **Refresh** on **Menu** or **Timer** controls.

Generally, painting a form or control is handled automatically while no events are occurring. However, there may be situations where you want the form or control updated immediately. For example, if you use a file list box, a directory list box, or a drive list box to show the current status of the directory structure, you can use **Refresh** to update the list whenever a change is made to the directory structure.

You can use the **Refresh** method on a **Data** control to open or reopen the database (if the **DatabaseName**, **ReadOnly**, **Exclusive**, or **Connect** property settings have changed) and rebuild the dynaset in the control's **Recordset** property.
