

Column Inspector Panel:

paste_6.tiff ↵

The *Column* inspector panel lets you change attributes of the Active Column.

The *Title* field lets you change the title of the Active Column. It is appropriately changed in all expressions that use that Columns title in their expression.

The *Expression* field lets you change the expression. When an invalid expression is given, the expression field restores its previous expression.

The *Full Expression* field shows the full expression by substituting expressions for Column names whenever possible.

The *Alignment* options align the values within the cells to either the left, center, or the right side of the cell.

The *Formatted* switch sets whether floating point numbers are autoranged, and sets the size of the fields to the left and right of the decimal point. *Left Digits* must be between 1 and 10. *Right Digits* must be between 0 and 14. If *Right Digits* is 0, then the fractional part of the floating point number is truncated (i.e., the floating point number is printed as if it were an integer). Otherwise, *Left Digits* specifies the number of digits to the left of the decimal point, and *Right Digits* specifies the number of digits to the right. If *autoRange* is YES, then the number will be fit into a field which is *Left Digits* + *Right Digits* + 1 spaces wide and the decimal point will be autoranged to fit that field (the field will also be padded with 0's).
