Document Inspector Panel:

paste_7_1_1.tiff ¬

The *Document Inspector* lets you examine and change attributes of the entire Document.

The Document name is printed in full form in the first field.

The *Auto Recalc* option forces Columns to recalculate whenever a Column which they depend on changes.

The *Columns Locked Together* option binds Columns together that are dependant on each other for the purposes of inserting cells, deleting cells, and scrolling.   When cells are deleted in one Column, corresponding cells at the same row in other dependent Columns are also destroyed.   The same behavior occurs when cells are inserted.   When cell are pasted or cut in a Column which is locked, spaces are created in the other locked Columns where these new cells were inserted.   The purpose of this feature is to force a strong x-y pairing between a Column or set of Columns and avoid a mismatch of x-y pairs.

The *Autoupdate Data Sets* option automatically updates any data sets that came from a Column which has just changed.   This feature can slow the application down somewhat.

The *Maximum Run of Cells* field displays how many items will be entered in a Column when a constant expression is given such as '2*PI'.

 The *New Column Width* field displays how wide a Column will be when it is created.   The width is given in points using 72 dpi.
