

# Copy / Paste Styles, Promote Styles

358755\_PixelRule.tiff ↗

Much like copying and pasting text, Wood allows you to copy and paste the style of a node on to another node . The commands used to accomplish this—Copy Style and Paste Style—are found under the Format menu. If you've developed fill and stroke styles for a certain node, you can just copy and paste it on to another node without having to specify them again in the Inspector panel.

In addition to these Commands you have the Command Promote Style, which applies the style of the selected node on every node of the subtree rooted at the selected node.

To use these commands, just select a node, choose the Copy Style command, then select a different node and choose the Paste Style command.
