IMPORTANT: This application requires **NeXTSTEP Release 3.0** or above.

What is QuickViewer ?

QuickViewer is a small application that load and display standard images (images with formats that are supported natively on the NeXTSTEP). These formats are: Encapsulated PostScript (**EPS;¬EPS**), Tagged Image File Format (**TIFF;¬TIFF**), RenderMan Interface Bytestream (**RIB;¬RIB**), and PostScript (**PS;¬PS**).

This program shows how easy one can put something on screen under NeXTSTEP, and the elegance of programming under the NeXTSTEP environment.

QuickViewer is never meant to be a serious application, it is just a quick (30 minutes ?) utility I wrote to do the following things:

1. Have something to display various supported format image files   on screen.
2. As a test of the 3.0 **3DKit**.
3. A tool to provide quick preview of **EPS** and **RIB** files when I am   hacking around these files.

So, enjoy it and happy NeXTing.
