For 3.0 Users:

Due to incompatiblities for loading bundles under NEXTSTEP 3.0 and 3.1/3.2, the supplied McFilter.preferences bundle will not load under 3.0. I would have provided a 3.0 binary, however, I simply don't have access to any machines running 3.0 anymore.

You can work around this by compiling the McFilter.bproj project in the Sources directory. You should be able to open the project, move to the Build function, set the target to "install", and then press the Build button.

After the build completes, the McFilter.preferences module should be in the Sources directory. Simply drag this module to your ~/Library/Preferences folder, or the /LocalLibrary/Preferences folder for network use.

The supplied A_McFilter.service should run under 3.0, although I haven't been able to verify it. Note that compilation of the McFilter service requires the Independent JPEG Group's conversion library to compile (which is not included in this distribution).
