# Write your own Filter

358755_PixelRule.tiff ¬

Start with the source code for the filters shipped with Wood.

If you want to use lex/yacc tools I recommend flex and bison, which let you define the prefix of the functions they generate. This is important for dynamically loaded code, which must have unique symbols. The flex library is linked in Wood, you don't have to provide it in your bundle.

Do not compress the Help directory of your filter or Wood won't be able to load it.

Contact me if you have problems.

Good luck!
