Introduction

235127_PixelRule.tiff ¬

674514_paste.tiff ¬ Calendar is a Multi-Calendar tool. This program allows
you to quickly see any Calendar. This new version evens
let you see many calendars at the same time.

Calendar   is based on about five lines of code that a friend gave
me. This little routine makes a pipe to Unix. Then it sends the cal
command to Unix, captures the results and sends the output to my
window. So here is my implementation of a calendar on a NeXT.
The source code that my friend gave me comes from an unknown
source. (I think it's from a magazine, but then again I'm not
sure???)

Try September 1752. Consult the manual page for cal for
details...   This is a competely new version, made for
NeXTSTEP 3.0.   Look in the other applications from the same
author for details.

(;OtherApps.rtfd;;¬   To see the other applications from the same author.)

Thank you.
