

Application (DefaultValues)

Inherits From:	MySuperObject
Conforms To:	MyProtocol
Declared In:	Application+DefaultValues.h
Depends On:	MySecondClass.h

Class Description

Place class description here.

Instance Variables

id **firstID**;
id **secondID**;

firstID	Just a temp.
secondID	Another temp.

Method Types

- myMethod

Class Methods

Instance Methods

didAutolaunch

- (BOOL)**didAutolaunch**

Returns whether the application was launched by the user or by some autolaunch mechanism (e.g. Service, Workspace autolaunch path,...).

See also: - **myReference**

knowsDefaultValue:

- (BOOL)**knowsDefaultValue:**(const char *)*defName*

Returns YES if the defaults system has a valid value for the specified *defaultName*. Use this method before reading any value. This gives you the chance to use app internal defaults.
