

Play Pitch Analysis

This panel allows you to run your `.pch` file through a program that plays pch files ± the default program is Paul Lansky's `playpitchanal`. You may enter the range of frames to be processed in the **Frame1** and **Frame2** fields. If you have a selection already made in the PCH plot, then the values of that selection will be entered in to the frames fields.

If you specify a output sound file, either by typing it into the provided field, or using the **Output Soundfile** button to select a sound, the results of the pitch analysis will be placed there. Otherwise a sound named `/tmp/anal.snd` will be created for you when you press the **Analysis** button. To hear the sound created, press the **Play** button.
