

id)awakeFromNib

Implemented to prepare an object for service after it has been loaded from an Interface Builder archive—a so-called “nib file”. An awakeFromNib message is sent to each object loaded from the archive, but only if it can respond to the message, and only after all the objects in the archive have been loaded and initialized. When an object receives an awakeFromNib message, it's already guaranteed to have all its outlet instance variables set. There's no default awakeFromNib method.
