

(void)ignoreSpelling:(id)sender

(id)ignoreSpelling:(id)sender

Implement to allow an application to ignore misspelled words on a document-by-document basis. This message is sent by the NSSpellChecker instance to the object whose text is being checked. To inform the NSSpellChecker that a particular spelling should be ignored, the receiver asks the NSSpellChecker for the string value of its selected cell. It then sends the NSSpellChecker an ignoreWord:inSpellDocumentWithTag: message.
