

<code>initWithLocal:(id)target connection:(NSConnection *)connection</code>	Builds a local proxy for a local object target, forming a remote proxy on the other side of connection. You may not retain or otherwise use this proxy.
<code>initWithTarget:(id)target connection:(NSConnection *)connection</code>	Builds a remote proxy where target is an object on the other side of connection. It may deallocate and return nil if this target is already known on the connection. This is the designated initializer for subclasses.
<code>(id)setProtocolForProxy:(Protocol *)proto</code>	Sets the proxy's protocol to proto for efficiency.
<code>(NSConnection *)connectionForProxy</code>	Returns the NSConnection instance used by the proxy.
