

NSArray *)arguments	Returns the arguments as an array of NSStrings from the command line.
NSDictionary *)environment	Returns a dictionary of variables defined for the environment from which the process was launched.
NSString *)hostName	Returns the name of the host system.
NSString *)processName	Returns the name of the process under which this program's user defaults domain is created, and is the name used in error messages. It does not uniquely identify the process.
NSString *)globallyUniqueString	Returns a globally unique string to identify the process. This method uses the host name, process ID, and a timestamp to ensure that the string returned will be globally unique.
- (void)setProcessName:(NSString *)newName	Sets the name of the process to newName. Warning: Aspects of the environment like userDefaults might depend on the process name, so be very careful if you change this. Setting the process name this way is not thread-safe.
