# To Do

266379\_PixelRule.tiff ↗

Some things that might be added to QuickProject in the future

- Preferences for your favourite Makefile.preamble and Makefile.postamble lines;  
(although you could always set up a Makefile.preamble/postamble inside the project template)
- Implement the Make Icon icon creation feature - a way of quickly creating a sample icon. Maybe it's the first letter of the name of the program written in an interesting font. Maybe every time you click it, it makes a different icon until you find one you like.
- Come up with some rationalization about why the icon for this program is a snowman. (current answer: I just thought it looked nice.)
