

Seminar Announcement:

Object Based Computing on the NeXT System

Dan McCreary
Systems Engineer
NeXT Inc.

Every NeXT system comes bundled with a revolutionary software development environment which allows software developers to create custom applications in a fraction of the time needed on other systems. Because the entire NeXT system is based on principals of object based computing it is easy for developers to create new objects as well as extend objects supplied with the NeXT environment and other third parties. This session will include a demonstration of the NeXT Interface Builder and its ability to edit and connect NeXT Application Kit objects to create user interfaces without a knowledge of procedural programming.

Time: approximately two 45 minute sessions
