Subject: Some hopefully useful code snippets...

Two useful things I came up with over the last couple of weeks. Hope they help somebody.

```
/* HostPicker Method
```

Assumptions:

- * you have an instance variable named hostField where you store the hostname.
 - * every hostname in every netinfo subdomain is accessible to your system.
 - * add libni_s.a to your libraries in ProjectBuilder.
 - * Connect a button to this and voila!
- ```
*/
```

```
- pickHostName:sender
{
 id thePanel = [NIOpenPanel new];
 [thePanel setListTitle: "Machine Names"];
 [thePanel setPanelTitle: "Machine Name Picker"];

 if ([thePanel runModal] == NX_OKTAG)
 {
 const char *fullDomain = [thePanel directory];
 if (fullDomain && *fullDomain){
 [hostField setStringValue: (char *)fullDomain];
 //[self changeHostName:self];
 //optional, add this method if you want to trigger the change.
 }
 }
 return self;
}
```
