

Jon,

Dolphin Kit (a commercial product) currently has DSMailer, DSNeXTMailer, and plans for the release of DSMIMEMailer later this summer. I don't know if you were thinking of <sup>a</sup>anywhere,<sup>o</sup> or <sup>a</sup>within MiscKit<sup>o</sup> when you asked your question. These objects are sendmail-level mail formatters which, in the case of the NeXT & MIME formats, work at the Text level. Here are the doc's for DSNeXTMailer, FYI¼

DSNeXTMailer.rtf

Note the **textFromText:** method, which takes a complete RTF (including attachments) Text body and forms it into a message. It should work the same in the MIME object, whenever we get around to releasing it. But, unfortunately, I've no dates for you¼
