

Hi,

I don't know what all is going on with MiscKit and document architecture classes, but I thought I'd let you take a look at my current efforts. These classes are being polished up and finished for the final MOKit. I thought you might be interested in terms of ideas for the MiscKit effort in the document direction. From the postings over the last few days, it would seem that there is at least one set of classes someone is working on.

On a related note, what are your thoughts on the duplication between parts of our projects. Most obviously, we both have a string object. I would tend to say that it is not to MiscKits benefit to have multiple choices for the same objects (especially strings, although I wouldn't say either of our string stuff is the perfect solution), yet many of my objects use MOStrings heavily in their implementation.

Anyway, here is my current test project for MOKit's document architecture classes.

ControllerTest  
ControllerTest

Please feel free to pass on the test app above to whoever is closely involved in this document arch stuff. The issues file deals with areas I haven't quite gotten around to, but should definitely be dealt with eventually.

PS. If I'm not on the misc-kit developer topic mailing list, please add me to it.
