From: Bill Bumgarner <bbum@friday.com>

If you want to know what uses the MiscKit, this *completely bogus* perl
script will give you a good approximiation.   Note that it searches for
"MiscString", so it will find *any* app that contains MiscString.

This is a complete and total hacque -- it does not work correctly at all
[other than finding apps that use MiscString].   If invoked on a large
directory, it dies.   If the moon is in the wrong place, it will probably
die, as well.

Though it is designed to search any directory you specify [using the
find.pl perl library], it dies w/random errors on really large directories
-- I would suggest invoking it as such [it seems to not die quite as often
this way]:

list-misc /LocalApps/*

Note: this hasn't yet worked right for me on my machine and I haven't had time to play with it any...so if anyone wants to spruce it up, please do! -Don Yacktman
