NormalBrowser
by Sharon Zakhour, NeXT Developer Support Team

Overview

This mini-example illustrates how to implement a normal browser.   The user interface, created in IB, consists of a single window with an NXBrowser instance, myBrowser.

Program Organization

How to build the nib files
The only connection is one from the File's Owner [the Controller] to the browser, myBrowser, which is an outlet of the Controller class.

Class[es] in the Application

 Controller   The Controller class, a subclass of Application, is also the NXBrowser delegate. The browser is filled on application startup in the appDidInit: method.   The contents of the browser are generated on the fly.

Other References

The BusyBox example -- in /NextDeveloper/Examples/AppKit   -- illustrates how to implement a lazy browser in its help facility.

Change History

· 2/22/93   lcox: Updated to 3.0.   Changes were:
                · Replaced all of the "#import <appkit/Class.h>" lines with "#import <appkit/appkit.h> in

the Header files.
· 6/22/93   lcox: Updated PB.project.   Changes were:
                · Made NormalBrowser.nib localizable
                · Added Makefile to the Supporting Files suitcase

Valid for 3.0
