

Release 0.02, 05.07.1996 by Aleksey Sudakov (zander@cnext.crec.mipt.ru)

2 *Release Notes and some History*

This chapter contains the release notes to all the ComponentEditor versions. It documents new features, the development steps taken, major bugs that have been fixed and bugs that are known.

Version 0.03

The third public release was on 05.07.1996. It's again mostly a maintenance release. Sorry, no time for enhancements.

New Features

What's new this time?

- **Fixed Mono-spaced Font.**

Well, as long as text coloring is a wish I guess this is the best solution.

- **Added Find panel and Print Menu Item.**

Well, I completely forgot about it in v0.02. Thanks Steve Hayman for reminding me.

Bugs Fixed in Release 0.03

There were so many stupid bugs inside v0.02 that I won't list all the small fixes. These are the most serious bugs fixed.

- **Fixed resizing behavior of EditorWindow.nib.**

Thanks Richard Scholz.

Version 0.02

The second public release was on 03.03.1996. It's mostly a maintenance release. I tried to make a useful and save app out of the ugly first release. It should be a lot stable now.

New Features

What's new this time?

- **Arbitrary Keybindings.**
With the help of the XText. Robert Gottlieb added the XScroller object.
- **Ability to double click on .wo files.**
This wasn't included in v0.01 because components could be placed inside .wo directory, but since Robert Gottlieb need it, he added it.
- **Added missing new, Windows and Services menus.**
Well, I completely forgot about it in v0.01. Thanks Robert again for reminding me.
- **Ability to automatically resize Text objects to size of the group.**
ComponentEditor now does handle switching between All files, HTML Template, Declaration and Script editing modes.
- **Proper exit and Window closing.**
Closing the window frees instance variables. You are get an alert if the contents hasn't been save yet. The app deals with quitting as it should according to NeXTs guide lines.

Bugs Fixed in Release 0.02

There were so many stupid bugs inside v0.01 that I won't list all the small fixes. These are the most serious bugs fixed.

- **Crashes after deciding to cancel while opening a component.**

No more crashes. Thanks Robert Gottlieb.

- **Saving.**
Now it saves just what it should. No more empty files!
- **Memory Leaks.**
Now we really free our main editors.

Development

Ok. Here is what I did to kick out this version.

Mar. 96: Spent most of the time writing this docu and making the program useful. Well, actually all the time was spent on .wod and .wos file parsing and thinking about new interface design, but this part wasn't ready.

Version 0.1

The first public release of 02.02.96. Therefore everything is new. Nothing will work as expected. This is a fast hack to trigger of some discussion and get some feedback in the early stage.

New Features

Here is a short summary of all the parts that are working now. See the introduction chapter for a list of ideas on future development efforts.

- **Loading Files**

Open multiple sets of *.html*, *.wod* and *.wos* files.

Development

Here I'll try to show you on which parts I did focus my work in this release.

Feb. 96: Just implemented the idea.
