runModal

runModalWithString:
runModalWithUneditableString:

Getting data from the panel panelSizeDefaultName
directory

Target and action methods cellWasHitInItemList:

Manipulating the panel setStartingDomainPath:
refreshLowerData:

cellWasHitInItemList:sender

This method is invoked when the user clicks in the lower browser. Returns self.

(const char *)directory

Returns the value of the directory selected by the user in the lower browser.

(const char *)panelSizeDefaultName

Returns the name of a constant representing the size of the panel. Used in conjunction with the inherited method resizePanelBeforeShowing:.

(int)runModalWithString:(char *)initialValue

Runs the panel, supplying a value to be placed in the text field of the lower half of the panel. The value
by the user. Returns the exit flags from the panel.

(int)runModalWithUneditableString:(char *)initialValue

Same as runModalWithString:, except that the supplied value can't be modified by the user. Force
specific item and allows the user to cancel if a conflict exists. Returns the exit flags from the panel.

setStartingDomainPath:(const char *)directory

Sets the path to the domain in the upper browser. This directory will be selected when the browser
if the path can be resolved otherwise, returns nil.
