

Click at the **OK** button to open the marked templates for backup. Click the **New** button to add files to a blank template. Click the **Cancel** button to open marked template without doing backup. **Double-click** on a template will open it.

The template marked with **\*** will be opened when you drag-and-drop icons onto the program's icon. The template is used to determine whether the icons are backed up before. If they are then old backup disks will be used to update the files if they have changed since last backup.

Templates marked with **â†\$** will be opened one by one when the program is double-clicked. Files in each template will be backed up if needed.

You can change what template to open by reassigning the marks. To change the marks, click in the column of the marks at left of the template names.

Check the **Hide Dialog** box if you do not want to see this dialog at next backup. The program will use what is shown as default. Hold down the **Control** key when the program is opened will force the dialog to appear.

This is a list of backup templates used previously. A template is automatically put into the list when you open it. You can save groups of marked templates as sets. Each set represents a particular backup strategy.
