    --- BeatIt 1.1 - last modified: 19.04.99 ---
```

1.2 Introduction

```
1 - Introduction
=====
```

BeatIt is a netbeat clock for AmigaOS. It displays the so called "beat" in a small window on the desktop. One day consists of 1000 beats. The beat was invented by Swatch®, a watchmaker located in switzerland.

1.3 Usage

```
2 - Usage
=====
```

First make sure that you have the times.font installed in your FONTS: directory.

Simply start BeatIt from Workbench. You can also start it from CLI or WBStartup...

If you are not living in a country where GMT is valid, you have to set the environment-variable ENV:TZ. It must start with the timezone as offset from GMT in the \ensuremath{\pm}hhmm format. This is compatible to the "beet" program by ELAL Kosher.

To set the variable type the following: setenv TZ +0100
This is the correct value for e.g. Germany.

To quit BeatIt click the top-left of the window.

1.4 Prefs

3 - Preferences
=====

This is a limited feature in this version :-)
The only thing you can do is to set the window-position.

To do so, just edit the file "BeatIt.prefs" with an editor and write the X-coordinate into the first line and the Y-coordinate into the second line. This file must be in the same directory as BeatIt.

Maybe there will be more options in future.

1.5 Bugs

4 - Bugs
=====

Yes, of course :-)

There will be two Enforcer-hits when starting BeatIt. This is a bug in ACE when opening a font :-)

1.6 History

5 - History
=====

V1.0
first version :-)

V1.1

Mathematical bug corrected: now the beat doesn't top the @1000 mark.

Guide added.
