

BinaryPrinting V1.30

© Uli Mittermaier

Program Description

BinaryPrinting is a utility for printing in the Windows 3.1 environment. If you want to send a PostScript or any other binary file to your printer, you don't have to issue a DOS command like `copy /b file.ps prn:` anymore.

Instead drag the files you would like to print from the File Manager and drop them on the BinaryPrinting icon. Then a dialog box where you may choose the port appears. If you want to print to LPT1: just press enter as it will be selected by default.

If you prefer that BinaryPrinting doesn't run all the time you may also specify the files you would like to print as parameters on the command line:

```
binarypr file1.ps file2.ps file3.ps
```

This feature is very useful if you use an iconbar that supports dropping files on its icons. In this case you would drag files from the File Manager and drop them on the BinaryPrinting-icon of the iconbar. Then BinaryPrinting will be launched by the iconbar with the dropped files as parameters on the command line. When the printing is finished, BinaryPrinting will close down itself.

By checking the 'Always on Top'-option in the menu that appears when you click once on the icon, you are able to make BinaryPrinting floating on top of all the others windows. Your selection will be stored in WIN.INI. That means the program remains on top until you uncheck the feature.

Please [register](#), if you find BinaryPrinting useful.

Registration

Registration Information

BinaryPrinting is Shareware.

If you want to use this program beyond a free 30-day-trial-period you have to register your copy.

BinaryPrinting may be distributed, if it is not modified in any way. If you continue using the program, please register your copy.

If you have any questions or find any bugs, please report them to me.

Registration fee for BinaryPrinting V1.30:

Single license: USD 5.00

Site license: USD 100.00
