

Unless the specified fractiles match the fractiles of a lognormal distribution perfectly, DynRisk will have to make adjustments to the specified values. To see the adjusted values, you can press the "Fit" button.

It is not at all necessary to do this, but sometimes it could be of interest to know which values DynRisk is using in the simulations. To get the specified values back again, you can press the "Fit" once more while pressing the "Shift"-key on the keyboard.
