

The result file

Select “Open...” from the “File” menu and open the result file, i.e., “Chocolate.data”. The result file appears as a table.

Notice that the result file has a different toolbar.

Most of these buttons are used to produce various plots to visualize the data.

The “Main table” is the default table. You can, however, change this table (and any other table in DynRisk) by clicking the popup menus in the table heads.

By selecting an item from this menu, the corresponding attribute or statistic is displayed in the table.
