

Node editing

A DynRisk node has many different properties or attributes. Most of these can be viewed and edited in the “Edit node” dialog box which appears when you “open” a node. A node is opened by double-clicking it. Alternatively, you can select the node and use the “Open node(s)...” command in the “Model” menu. [The latter method is most useful if you want to edit a sequence of nodes.]

The “Edit node” dialog box is split up into three different views:

- Identity
- Distribution
- Operators

To select a particular view, you click on its corresponding icon in the icon bar at the left-hand side of the dialog box.
