

In addition to the objects used directly in the modeling, DynRisk also allows you to incorporate several other types of objects. These objects can be included to make the models more readable and easy to understand and maintain.

Comments

You can include short comments in model files by using the “New comment...” command in the “Model” menu. Comments are stored within a model file as picture objects. You can select and move comments in the same way you select and move nodes.

To create a comment object in a specific folder, open the folder, and choose “New comment...”. This will bring up a dialog box where you can enter the comment text.
