In "Node table view" the node data is displayed in a table. Before you can edit a table field, it must be activated. To quickly activate a field, you click it with the mouse. As soon as a table field is active, you can move around to other fields in the table using arrow keys, just like in a spreadsheet table. Alternatively you can move around by using the "Tab" key, "Shift-Tab" key, "Return" key and "Shift-Return" key.

The content of an edited table field is stored in the model as soon as you deactivate the field. A field is deactivated when another field is activated. To deactivate a table field without activating another field, just press the "Enter" key, or alternatively the "Escape" key, or click at some empty spot somewhere in the window.
