

The “Edge table view” works almost in the same way as the “Node table view”. You activate fields by clicking them. You can use the “Fill down” and “Fill up” commands, and copy and paste contents just as in the “Node table view”. However, you cannot move edges to other directories, and it is not possible to add new edges in this view.

Still, the main difference compared to the “Node table view” is that the “Edge table view” displays edge attributes instead of node attributes.

Note also that since edges do not have their own names in DynRisk, they are typically identified by the names or codes of their respective input and output nodes.
