DynRisk offers several plots for comparing statistics of data nodes. These plots are referred to as "series plots", and include "Line charts", "Bar charts", "Column charts" and "Pie charts". All these plots have several variations as well.

Note that some statistics are only available if the simulation included both the "Main simulation" and the "Crit. simulation" phases.

To create a plot, select the data nodes you want to include in the plot, and use the appropriate command in the "Gallery" or alternatively click the corresponding button in the toolbar. As a result a dialog box appears where you can select further plot options.
